Background and objectives: β-glucans are soluble and fermentable fibers that, once in the intestine can compose solutions presenting benefits for health. The amount of yeast β-glucans in foods must range between 50 and 200 mg per serving (EFSA). However, the influence of β-glucans addition on bread sensory characteristics was not understood. Quality control of bread was based on texture and color, since both parameters affect consumer preference. The objective was study the effect of adding different levels of β-glucans extracted from yeast cell wall to improve the bread´s characteristics.

Methods: Breads were made from 500 g of flour mixture for bread and variable amounts of β-glucans (0; 0.5; 1; 1.5 and 2 g). Volume was evaluated. For texture assay a TA-XT-2iHR Texture Analyser. Regarding color, lightness (L*), redness (a*) and yellowness (b*) were determined using a Minolta CR-300 colorimeter.

Results: The bread displaying the largest volume was that with a dose of 1.5 g . For Hardness, the highest value corresponded to the 0 g dose and the lowest to the 1.5 g one; whereas for Elasticity, the highest was for 1.5 g and the lowest for 0g and 0.5 g; the highest value for Masticability corresponded to 0.5 g and the lowest one to 1.5 g. In respect to color, L* was the highest for the 1.5 g; a* was the highest for 0 g and the lowest for 1.5 g; b* was the highest for 0 g and the lowest for 1.5 g.

Conclusions: More studies are needed to confirm the influence of β-glucans addition to bread using different baking conditions.

Key words: bread, β-glucans, texture, color.

BIOACTIVE ANDCLAIMS : REGULATORYSYSYTEM IN CHINA

Y. Yuexin[1]

[1]National Institute of Nutrition and Food Safety, China

Background and objectives: Chinese have a long tradition and strong passing for using heber and specific foods to be as a tonics and to regulate body functions.In the present, regulation system defines health foods as foods with specific health functions.

Methods: RegulationOverview and Comparativeanalysis.

Results: The paper Introduce the regulation system on function claim and nutrition claim in China, and compare with EU and US to Ingredient and claim on science approach and management. There are a rule for function food and novel Ingredients; convention food which makes nutrition and function claims of nutritional benefits on its label or packaging (nutrition Labeling, GB28050).

Conclusions: There are novel ingredient approvalregulation, 27 claims that are allowed, more than 10 thousand products in the marketing . The approach procedure is difference with other countries.

Key words: Novel ingredient, Function claims;label

MICROENCAPSULATED GREEN TEA EXTRACT SUPPLEMENTATION AMELIORATED DYSLIPIDEMIA AND FAT ACCUMULATION IN A FRUCTOSE FED RAT MODEL

M. Chang[1],Y. Jun[1], M. Kim[2], P. Seoung[3]

[1]Department of Food and Nutrition, Kookmin University, Seoul, Republic of Korea
[2]Department of Food Engineering, Dankook University, Cheonan, Republic of Korea
[3]National Institute of Animal Science, RDA, Suwon, Republic of Korea

Background and objectives: The effectiveness of polyphenols depends on preserving the stability, bioactive and bioavailability of the active ingredients. To protect polyphenolic green tea extract from adverse environmental conditions, it was microencapsulatedwith mean diameters of 3.4 ìm using maltodextrin (1:4, v/v) as a carrier and coating agents by hydroshear homogenization at 8,000rpm for 30 min.This study was initiated to compare the effects of microencapsulated green tea extract (MGTE) and non capsulated green tea extract (GTE) on hypertriglyceridemia induced by feeding a high fructose diet in wistar rats.

Methods: 8 week old rats were fed either AIN 93 diet (normal control, NC, n=10), or modified AIN-93 diet in which cornstarch was substituted with 63% fructose to induce hypertriglyceridemia for 8 weeks. The hypertriglyceridemic rats were treated with daily oral dosed of 0 mg (hypergriglyceridemic control, HC, n=10),GTE(n=10) or MGET(n=10) with dose of 50mg•kg bw-1d-1 for 4 weeks. Serum lipid profiles, visceral fat accumulation and antioxidative enzymes were analyzed.

Results: The serum triglycerides (TG), total cholesterol, HDL-cholesterol and uric acid (UA) were significantly increased by feeding a fructose diet. The treatment of GTE decreased serum TG and FFA levels compared with those of HC group. The supplementation ofMGTE caused more decrease inserum TG, FFA, and UA than GTE did. The supplementation of GTE or MGTE in hypertriglyceridemic rats decreased the amount of epididymal fat and visceral fat significantly compared to those in HC group.

Conclusions: Our results indicated that the utilization of microencapsulated green tea extract, instead of free compounds, can effectively alleviate the dyslipidemia and fat accumulation induced by high fructose diet.This research was supported by joint research project (#PJ9071222012) from Rural Development Administration, Republic of Korea.

Key words: Microencapsulation, green tea extract, hypertriglyceridemia.

PO2965

ANALYSES OF A POLYPHENOL AGLYCONE PROFILE IN FRUIT AND VEGETABLES BY LC-MS QTOF

L L. Hamill[1], W C. McRoberts[2], S D. Floyd[2], M C. McKinley[1], I S. Young[1], J V. Woodside[1]

[1]Centre for Public Health, Queen's University Belfast, Institute of Clinical Science B, Grosvenor Road, Belfast, BT12 6BJ, Northern Ireland, UK
[2]Food Chemistry Division, Agri-Food and Biosciences Institute, Newforge Lane, Belfast BT9 5PX, Northern Ireland, UK

Background and objectives: Epidemiological data indicates that increased intake of fruit and vegetables (FV) is associated with decreased incidence of chronic diseases. FV contain potentially protective components which may account for health benefits associated with increased intakes, including polyphenols. However, to determine polyphenol intake from FV it is important to assess content.

Methods: Data, collected within our centre, identified commonly consumed FV in Northern Ireland. One aim of our work was to measure polyphenol content of these FV. Samples (n 2) of each were lyophilised, milled and 0.05g was hydrolysed with enzymes. A profile of 14 polyphenol aglycones (flavonoids and phenolic acids) were analysed by LC-MS QToF, within a single run.

Results: Data are presented as mg/100gfw ± SD. Content for raw and cooked cauliflower, respectively, were: chlorogenic acid (chl), 0.06 ± 0.00 v. 0.16 ± 0.00; caffeic acid, 0.26 ± 0.04 v. 0.11 ± 0.01; para-coumaric acid (p-cou), 0.14 ± 0.00 v. 0.03 ± 0.01 and quercetin, 0.02 ± 0.00 v. 0.00 ± 0.00. Chl content for raw and cooked parsnip was 0.24 ± 0.05 v. 0.18 ± 0.02Chl content for gem and ice-berg lettuce was 1.00 ± 0.11 v. 0.57 ± 0.06p-cou content for raw and cooked cabbage was 0.07 ± 0.01 v. 0.03 ± 0.00. Although un-ripe, ripe and over-ripe bananas were analysed, and epicatechin was present, amounts were <LOD.

Conclusions: Our results indicate that polyphenols are present in FV and therefore may play a role in beneficial effects associated with increased consumption. However, before we can fully establish impact on human health, further research is required, measuring polyphenol content in other FV, and examining the effect of ripeness, cultivar and domestic cooking. This research is on-going within our centre.Acknowledgements: Work is funded by the MRC.

Key words: fruit, vegetables, polyphenols

PO2966

EFFECT OF DAIRY CALCIUM FROM CHEESE AND MILK ON BLOOD LIPIDS IN HEALTHY YOUNG MEN

K V. Sørensen[1], T K. Thorning[1], A. Astrup[1], M. Kristensen[1], J K. Lorenzen[1]

[1]Department of Nutrition Exercise and Sports, University of Copenhagen, Frederiksberg C, Denmark

Background and objectives: Calcium from different dairy sources might affect blood lipids differently due to differences in food matrix and nutritional composition of the individual dairy products.The aim of this study was to investigate the effect of high dairy calcium intake in the matrix of cheese or milk on blood lipid profile.

Methods: Fifteen healthy young men participated in a randomized cross-over study with three isocaloric 14-days intervention diets: i) high intake of semi skimmed milk (1200 mg dairy calcium/day and ~500 mg non-dairy calcium/day); ii) high intake of semi hard cows cheese (1200 mg dairy calcium/day and ~500 mg calcium from non-dairy sources) or iii) non-dairy calcium control diet (~500 mg non-dairy calcium/day). All diets were similar in macro¬nutrients, dietary fiber and fatty acid composition. Fasting blood samples were taken before and after each diet period.

Results: Compared to non-dairy calcium, cheese consumption attenuated the increase in both total and LDL cholesterol (-0.48 ± 0.14 and -0.37 ± 0.12 mmol/L, respectively; Pdiff. < 0.01). Likewise, milk consumption attenuated the increase in total and LDL cholesterol (-0.32 ± 0.14 and -0.31 ± 0.12 mmol/L; Pdiff. < 0.05); however the magnitude of effect was slightly smaller than for cheese and no difference was found between the cheese and the milk diet (Pdiff. > 0.24). There was no effect of diet on changes in HDL cholesterol, triglycerides or lipid ratios.

Conclusions: Dairy calcium from milk and cheese attenuated fat-induced increases in total and LDL cholesterol. No difference between dairy calcium sources were found, thus these results do not confirm the hypothesis that the blood lipid response by dairy calcium depends on the dairy product type.

Key words: Dairy, calcium, blood lipids, milk, cheese

PO2967

INTESTINAL INFLAMMATION IN CYSTIC FIBROSIS: LACK OF EFFECTIVENESS AFTER TREATMENT WITH MESALAMINE AND PROBIOTICS

V M. Navas-López[1], J. Blasco-Alonso[1], F. Girón Fernández-Crehuet[1], M J. Serrano Nieto[1], M I. Vicioso Recio[2], C. Sierra Salinas[1]

[1]Pediatric Gastroenterology and Nutrition Unit, Hospital Materno Infantil, Málaga, Spain
[2]Laboratory Unit, Hospital Materno Infantilm, Málaga, Spain

Background and objectives: There is some evidence of intestinal inflammation in patients with Cystic Fibrosis (CF) but little is known about the pathophysiology. The objective was to assess the incidence of intestinal inflammation measuring faecal calprotectin (FC) and intestinal permeability (IP) in children with CF and to investigate whether mesalamine or probiotics could modify the inflammation.

Methods: FC (µg/g) and IP were assessed in CF patients before and after one-month treatment with mesalamine and VSL#3. IP was measured by dual test with lactulose (L) and mannitol (M). Fecal nitrogen and fat were obtained by Fenir (g/day).

Results:

Mesalamine treated patients (n= 25)	Basal	After treatment
FC (µg/g)	275 ± 233	218 ± 218
Fat (g/24h)	6.7 ± 5.9	6.28 ± 5.9
Nitrogen (g/24h)	2.3 ± 1.9	2.11 ± 1.31
%Lactulose (L)	1.59 ± 1.2	1.77 ± 1.42
%Mannitol (M)	49.85 ± 50.35	35.73 ± 22.14
% L/M	0.047 ± 0.042	0.059 ± 0.044
L/M	0.238 ± 0.212	0.29 ± 0.22

VSL#3 treated patients (n=17)	Basal	After treatment
FC (µg/g)	221 ± 273	256 ± 298
Fat (g/24h)	6.09 ± 5.69	5.56 ± 4.11
Nitrogen (g/24h)	1.9 ± 1.5	1.83 ± 1.18
%Lactulose (L)	1.97 ± 2.33	2.13 ± 1.7
%Mannitol (M)	18.60 ± 11.01	26.83 ± 15.4
% L/M	0.12 ± 0.13	0.079 ± 0.04
L/M	0.6 ± 0.67	0.39 ± 0.20

No statistically significant difference was found after treatment in both groups of treatment

Conclusions: Children with CF have increase of intestinal inflammation.The treatment with mesalamine and VSL#3 did not reduce the intestinal inflammatory state. This lack of improvement expresses a complex mechanism, which should be investigated in further studies.

Key words: Cystic fibrosis, intestinal permeability, mesalamine, probiotics, fecal calprotectin

PO2968

EFFECT OF PREBIOTIC SUPPLEMENT TO ENTERAL FEEDINGS IN PREMATURE INFANTS: A CASE CONTROL STUDY

S. Shaaban[1], A.Elbialy[2], G. Ismail[3], S. Maher[1]

[1]Pediatrics Department, Faculty of Medicine, Ain Shams University, Cairo, Egypt
[2]Food and Technology Institute, Agricultural Research Center, Cairo, Egypt
[3]Clinical and Chemical Pathology Department, Faculty of Medicine, Ain Shams University, Cairo, Egypt

Background and objectives: Preterm infants are in critical need for a balanced intestinal microflora that may protect them against infection. The study of a potential role of prebiotic products in the care of premature infants remains in a very early stage. We aimed to assess the prebiotic effect of inulin supplement to NICU preterm infants.

Methods: An ongoing prospective, unblinded case control study in premature infants; GA < 34 weeks with a birth weight > 1000 gram. The study group receives inulin as a prebiotic mixed with the feeds twice daily, and control infants receive only the plain feeds (prebiotic and probiotic free formula) for a period of 42 days. Stools have been collected on the 7th, 21st and 42nd days of feed commencement and are subjected to Lactobacilli and Bifidobacteria enrichment cultures. Small part of the stools is stored at -70 degrees Centigrade for future assessment by real time qualitative PCR for Lactobacilli and Bifidobacteria presence. Weight, length and OFC measurements are assessed on weekly bases, Other investigated parameters are; gestational age at home discharge, antibiotics used and their duration during the NICU admission, routine labs, calcium and albumin.

Results: Thirty infants have been enrolled till now (15 inulin, 15 control). The supplement appeared to be safe and did not cause any adverse effects. Preliminary results showed that Premature infants on inlulin had more Lactobacilli- and Bifidobacteria-positive stool cultures that appeared earlier with larger number of colonies. Furthermore they tended to have less intolerance to enteral feedings, to reach full oral feeds sooner, and to be discharged home earlier.

Conclusions: The preliminary results support the safety and benefit of supplementing preterm infants' feeds with inulin waiting for the final outcome and the qualitative PCR results for confirmation.

Key words: premature, prebiotic, lactobacilli, bifidobacteria, PCR

PO2969

INHIBITORY EFFECTS OF SALVIA HISPANICA L. SEED EXTRACTS ON ANGIOTENSIN I-CONVERTING ENZYME IN VITRO

B. González- Martínez[1], V. González-Ramos[1], M. López-Cabanillas[1], J. Verde-Star[2]

[1]Universidad Autónoma de Nuevo León. Facultad de Salud Pública y Nutrición, Mexico
[2]Universidad Autónoma de Nuevo León. Facultad de Ciencias Biológicas, Mexico

Background and objectives: Currently, foods with functional compounds, which have the capability to act in a manner similar to drugs in certain pathological conditions but do not possess their side effects, have stimulated interest. It has been reported that Salvia hispanica L. seeds exert a hypotensive effect; however, the mechanism by which this effect is generated and which compounds are responsible for this effect are unknown. The inhibitory effects of angiotensin I-converting enzyme (ACE I) has not been previously described for this seed; such a mechanism was proposed based on the presence of certain compounds found in the chia seed, which showed an ACE-inhibiting effect in other foods. The purpose of the current study was to evaluate the potential of chia seed extracts on the inhibitory activity of ACE I in vitro, as well as to analyze the bioactive components in the extracts generating this effect.

Methods: Various extracts were studied (e.g., aqueous, methanol, acetone, and hexane). A phytochemical study of compounds present in chia extracts was performed using standard methods.

Results: The compounds present in the aqueous extract were only sugars; in the case of hexane and acetone extracts, unsaturated fatty acids and terpenoids were found, whereas in the methanol extract, phenolic oxides, glycosides, steroids, coumarins, unsaturated lipids, and carbonyl groups were found. IC50 values of the extracts on ACE I were 318±4.2 μg/mL, 218±5.6 μg/mL, and 63±3.7 μg/mL for hexane, acetone, and methanol extracts, respectively.

Conclusions: Results of this study show that active compounds exist, primarily in the methanol extract, which possess an ACE I-inhibiting effect that, in turn, could be responsible for the hypotensive effect already reported. These compounds could have biotechnological potential for the treatment of this hypertension.

Key words: chia, ACE, hypertension

PREBIOTIC EFFECT OF INULIN TYPE FRUCTANS: A FOCUS ON BIFIDOBACTERIUM POPULATIONS AND MICROBIAL RELATED METABOLITES IN OBESE INDIVIDUALS

N. Salazar[1], E M. Dewulf[1], A M. Neyrinck[1], L B. Bindels[1], P D. Cani[1], J. Mahillon[2], M. Gueimonde[3], C G. de los Reyes Gavilán[3], J P. Thissen[4], N M. Delzenne[1]

[1]Metabolism and Nutrition Research Group, Louvain Drug Research Institute, Université Catholique de Louvain, Brussels, Belgium
[2]Laboratory of Food and Environmental Microbiology, Earth and Life Institute, Université Catholique de Louvain, Louvain la Neuve, Belgium
[3]Departamento de Microbiologia y Bioquímica de Productos Lácteos, IPLA-CSIC, Villaviciosa, Spain
[4]Pole of Endocrinology, Diabetology and Nutrition, IREC, Université Catholique de Louvain, Brussels, Belgium

Background and objectives: Inulin type fructans (ITF) are non digestible carbohydrates that counteract the high-fat (HF) diet induced metabolic disorders in mice. Moreover it is well established that ITF promote the growth of Bifidobacterium genus. The aim of the work is to check the possible influence of ITF in the composition of Bifidobacterium species and related microbial metabolites in obese individuals.

Methods: For humans, samples were taken from a randomized, double blind study performed in overweight women treated with ITF prebiotics (Synergy 1) or placebo (maltodextrin) during 3 months (16 g/day) (Dewulf et al; 2012).For animals, male C57B16/J mice were divided into 3 groups treated for 4 weeks such as: CT group fed a control diet, HF group fed a HF diet, HF-ITF group fed a HF diet supplemented with ITF (0.2 g/day/mouse). The qualitative and quantitative analysis of the gut microbiota was analyzed by PCR-DGGE and q-PCR and SCFA by GC-MS. Correlation analysis between species of Bifidobacterium and some biological parameters were also performed in the human clinical trial.

Results: Bifidobacterium-DGGE profiles in the mice study showed different clustering groups and only 2 Bifidobacterium species were detected: B. animalis and B. pseudolongum. DGGE and q-PCR analysis of Bifidobacterium species in the clinical study have shown that B. longum, B. pseudocatenulatum and B. adolescentis were the predominant species and those that significantly increased at the end of the treatment in the group of women receiving ITF prebiotics. B. longum was also negatively correlated with metabolic endotoxaemia. After the treatment, caproate was significantly higher in feces of the placebo group.

Conclusions: ITF prebiotics selectively changed bifidobacterial population patterns in obese women and diet induced obese mice, opening the possibility to supplement diet with ITF to improve the intestinal microbial profile of obese individuals.

Key words: prebiotics, Bifidobacterium, gut microbiota, obesity

PO2971

ENCAPSULATION METHOD TO PROTECT UNSATURATED FATTY ACIDS FROM RUMEN BIOHYDROGENATION IN VITRO

R. Gawad[1], M. Strabel[2], H. Kattab[3], A. Cieslak's[2], S. Abo El-Nor[1], P. Zmora[2]

[1]Dairy Science Department, National Research Center, Egypt
[2]Department of Animal Nutrition and Feed Management, Poznan, Poland
[3]Animal Production Department, Ain Shams University Egypt

Background and objectives: Enrichment of ruminants' products with polyunsaturated fatty acids (PUFA) is one of the possibilities to introduce these fatty acids into the human diet. However, the rumen unsaturated fatty acids biohydrogenation limits their quantity and thus bioavailability in the rumen, as well as in animal products. The alginate/carrageenan calcium beads of linseed oil were evaluated in vitro to verify the ability of these products to protect PUFA from biohydrogenation by ruminal microbes.

Methods: The treatments were: control (C) without supplements, LB1 (control + 4% of linseed beads containing 15% oil), LB2 (control + 4% of linseed beads containing 20% oil), LO (control + 4% of linseed oil). Each product was supplemented (4% dry matter) to the substrate that comprises of a mixture of meadow hay and barley meal in the ratio of 60:40 and incubated using batch culture technique (BC) for 48 h. All samples (feeds and rumen fluid after incubation) were analyzed for fatty acids profile. Encapsulation efficiency was evaluated by measuring the changes in fatty acids profile in linseed oil before and in linseed beads after encapsulation process.

Results: The results indicated that the encapsulation process have no a significant effect on PUFA fraction ($P>0.01$). After incubation in BC system, linseed beads decreased ($P<0.01$) total rumen saturated and monounsaturated fatty acids content. Omega 3 and omega 6 fatty acids contents increased statistically ($P<0.01$) by LB1 and LB2The omega 3 values were 2.5, 17.9, 18.5 and 9.7 mg/100 mg FAME (fatty acid methyl esters), and omega 6 values were 8.7, 25.2, 26.9 and 17.6 mg/100 mg FAME, respectively for control, LB1, LB2 and LO treatments.

Conclusions: In conclusion, new encapsulation method has the potential to protect linseed oil from rumen biohydrogenation in vitro, however further in vivo experiments are required.

Key words: PUFA, rumen, biohydrogenation, encapsulation, in vitro

PO2972

PROTECTIVE EFFECT OF PROBIOTIC TREATMENT ON INTESTINAL MICROBIOTA AND POTENTIAL RISKS

S. Al-Okbi[1], M. Amin[2], O. Sharaf[3], A. Ali[2], A. Ramadan[1]

[1]Department of Food Sciences and Nutrition, National Research Centre, Cairo, Egypt
[2]Department of Microbiology and Immunology, Faculty of Pharmacy, Cairo University, Cairo, Egypt
[3]Department of Dairy Sciences, National Research Centre, Cairo, Egypt

Background and objectives: Probiotics and phytochemicals are functional foods that possess health benefits. Probiotics have profound effects against pathogenic bacteria and are known to improve intestinal health. In this work, we studied the potential benefit of selected probiotics (Lactobacillus acidophilus and Bifidobacterium bifidum) and functional food ingredients (methanol extract of chamomile) in prevention of intestinal microbiota perturbation following antibiotic treatment, their rolein improving colonic microbiota in healthy rats and the possible risk of translocation in immunosuppressed rat model.

Methods: The study was conducted on white male albino rats where different groups received either: ampicillin, probiotic mixture (1x10(8) Lactobacillus acidophilus and 1x10(9) Bifidobacterium bifidum), chamomile extract or combinations of the three categories. Indicator pathogenic and beneficial bacteria were enumerated in rat feces. The effect of probiotics and functional food ingredients on nutritional parameters and growth was assessed. The immunosuppressed model was constructed by induction of immunosuppression in female white albino rats using dexamethasone as 0.5 mg/kg IM injection for 1 week followed by probiotic mixture daily oral dose for another week. Blood samples were inoculated on MRS agar.

Results: Antibiotic treatment produced microbiota perturbation. Administration of probiotic mixture alone or mixed with chamomile extract simultaneously with ampicillin significantly restored the normal level of microbiota ($P < 0.05$). Ingestion of probiotic mixture alone or with chamomile extract in healthy rats produced significant increase in colon beneficial bacteria together with significant reduction of pathogenic bacteria compared to control rats. Blood infection with Lactobacillus acidophilus and Bifidobacterium bifidum was noticed in 5 out of 8 immunosuppressed rats.

Conclusions: Probiotics may prevent the imbalance in intestinal microbiota resulting from antibiotic treatment and may improve the intestinal ecology in favor of the beneficial bacteria. Probiotic treatment might have some risks in immunosuppressed cases; further investigation is needed in this respect.

Key words: Probiotics, antibiotic, microbiota.

PO2973

EFFECT OF TEMPERATURE AND DAY LENGTH ON OMEGA-3, 6 FATTY ACIDS AND OXALIC ACID LEVELS IN PORTULACA OLERACEA

H. Oduro-Obeng[1], T A. Ndanu[2], N.Dudai[3]

[1]Food, Nutrition and Socio-Economic Division, CSIR-Food Research Institute, Accra Ghana
[2]University of Ghana Dental School, College of Health Sciences, Korle-bu, Accra Ghana
[3]Agricultural Research Organization, Newe Ya'ar Research Center, Ramat Yishai, Israel

Background and objectives: Portulaca oleracea (PO) is known to be a nutritious plant with appreciable levels of plant omega (w-3) fatty acids. The purpose of this study was to access the effect of varying temperature and day length conditions on the levels of the fatty acids and oxalic acids in the leaves of three species of the PO.

Methods: Three Portulaca oleracea microspecies, P. sativa(POS) P. nitida(PON) and P. papillato-stellulata(POP) were analyzed for their fatty acid and oxalic acid profile under day and night temperatures of 34/28(A), 28/22(B), 22/16(C), 16/10(D) degree celcius and long(16hrs) and short(9hrs) day conditions. Leaves were harvest at 8-true-leave-stage for the chemical analysis.Gas chromatography (GC) was used to analyze the fatty acids while HPLC was used for the oxalic acid.

Results: Mean levels of w-6 was 11.0±5.7ug/100g, w-3 was 50.7±23.7 ug/100g dry-weight and oxalic acid 147.6±6.6ug/g fresh-weight.There was significant difference in the microspecies levels of w-6 and oxalic acid only, $p<0.05$W-6 was higher in the POS(13.8±6.10) and low inPOP(8.6±4.4). Oxalic acid was high in POP(149.2±6.2) and low in PON(145.4±7.1) Temperature significantly influenced the levels of the acids with higher temperature producing the highest acid contents ($p<0.05$). The w-6 ranged from (C=12.97±4.3 to D=7.90±8.8).W-3 from (B=62.03±7.6 to D=26.15±29.17) and oxalic acid, (D=152.27±6.6 to A=146.23±7.3). W-6 to w-3 ratio ranged from (C=0.22±0.15 to D=0.13±1.67). Only oxalic acid content showed significant differences between long day and short day ($p<0.05$). The values were LD(148.89±7.5)and SD(146.29±5.3).

Conclusions: The microspecies differed in their fatty acid (w-6) and oxalic acid contents. Temperature and day length had significant effect on these. There was significant interaction between day length, temperature and microspecies on the oxalic acid levels.The authors are grateful to Pears Foundation of England for financial support.

Key words: Portulaca oleracea; w-3, w-6 fatty acid, oxalic acid.

PO2974

ROLE OF BIO- ACTIVE YOGHURT AND FERMENTED SOBYA ON THE RESTORATION OF THE GUT BARRIER FUNCTION AND COLONIC METABOLIC ACTIVITY

M. Gouda[1], M. Mohamed[1], E. Labib[1], M. Tawfik[1], L. Hussein[1]

[1]National Research Center, Egypt

Background and objectives: Traditional fermented food commodities exert beneficial effects on public nutrition. The present study examines the effectiveness offermented sobya supplementson colonic metabolic activities.

Methods:A human trial consisting of32healthy male adolescents was designed . The subjects were divided into four groups of equal number; (1) served as control and received fermented rice milk porridge. (2), (3)(4) received daily 190 grams portion ofa fermented supplementSobya, commercially available fermentedrice based semi solid puree providing5.9 x 109and1.8 x 108;conventional yoghurtprovidingBifidobacteria andLactobacillusat3.8 x 109and6.46 x 109cfu, respectivelyorbio-active yoghurt lactel to provide respective bacterialcounts of2.8 x 108and9.7x109.Before the intervention and at the terminationof the trial, the urinary lactulose and mannitol dual test was assessedas indicator ofthe integrity ofintestinal permeability. Bacterial counts, pHvalues,hydrolytic enzyme activities and short chain fatty acidswere measured in the fecal samples.

Results: Fecal lactobacillus and Bifidobacterial counts increased significantly following the 3 week nutritional intervention with all fermented supplements.The mean fecal pH values decreased also significantly amongsubjects consuming the fermented products.The mean activities of fecal β-galactosidase, β-glucosidase and β-glucuronidasesincreased among the groupsconsuming sobya and bioactive yoghurt with variable degrees of magnitude. Fecal β-glucuronidase enzymes correlate directly with microbiome richnessand the diet composition partially explains the induction of genes expressing these enzymes.

Conclusions: Traditional fermented sobyaaffects the intestinal microbiota, These shifts had been linked to improving thecolonic barrier function. Development of traditional fermented products should be encouraged forpromoting the public nutrition of vulnerable groups.

CIRSIUM SETIDENS EXTRACTS INDUCES FATTY ACID OXIDATION AND DECREASES FAT ACCUMULATION IN THE LIVER OF A HIGH-FAT DIET FED MICE

J. Chung[1], H. Noh[1], H. Lee[1], E. Kim[1]

[1]Department of Food and Nutritoin, Kyung Hee University, Seoul, Rep. of Korea

Background and objectives: Cirsium setidens is a perennial medicinal herb that is rich in flavonoids, mostly pectolinarin. In this study, we investigated the effect of C. setidens ethanol extracts (CSE) against the development of non-alcoholic fatty liver in mice fed a high-fat diet.

Methods: C57BL/6J mice were fed either a control diet (CON) or a high-fat diet (HF) for 8 weeks, and then fed CON, HF, or HF with 100mg/kg BW CSE (HF+CSE) for additional 7 weeks.

Results: Body weight gain and adipose tissue weight of mice fed HF with CSE were significantly decreased compared to the HF group. Moreover, CSE administration markedly attenuated the lipid droplets in liver tissue and significantly decreased hepatic TG concentrations, indicating a protective effect against HF-induced fatty liver. CSE administration strongly induced the hepatic mRNA levels of carnitine palmitoyl transferase 1and medium-chain acyl dehydrogenase (MCAD), fatty acid oxidation enzymes, compared to HF group. Similar induction of MCAD mRNA by CSE was also observed in epididymal adipose tissue. Hepatic protein levels of phosphorylated-AMPK were higher in the HF+CSF group than in the HF group.

Conclusions: These results suggest that CSE decreases body weight gain and hepatic fat accumulation by up-regulating the gene expression of fatty acid oxidation enzymes.

Key words: Cirsium setidens, non-alcoholic fatty liver, fatty acid oxidation, mice

PO2977

ENHANCED WATER DISPERSIBILITY OF POORLY WATER-SOLUBLE POLYPHENOLS BY COMPLEXATION WITH CASEIN AND CASEIN HYDROLYSATE

T. Oshima[1], R. Yamashita[1], Y. Masuda[1], H. Takahashi[1], Y. Baba[1]

[1]Department of Applied Chemistry, University of Miyazaki, Japan

Background and objectives: The polyphenols curcumin and quercetin are potential chemotherapeutic agent. Curcumin and quercetin are practically insoluble in aqueous media

and poorly absorbed from the gastrointestinal tract, which results in insufficient bioavailability. The present study describes the complexation between poorly water-soluble polyphenols and casein as well as the mixture of peptides (Pep) prepared as casein hydrolysate, for enhancing the water dispersibility.

Methods: The complex was prepared by mixing an aqueous solution of containing casein or Pep with an organic solution of a polyphenol (curcumin and quercetin), followed by removal of organic solvent in vacuo and lyophilization to obtain the complex as a powder.

Results: The complexes were much more water-dispersible than polyohenol alone. The water dispersibility increased as the quantity of casein or peptide in the complex increased. The particle size of the complex in aqueous media was around 150–350 nm, which suggests that the complex is a hydrocolloidal material in aqueous media. Characterization of the complex by scanning electron microscopy, differential scanning calorimetry, and zeta potential measurement showed polyphenols were incorporated in the hydrocolloid in an amorphous state.

Conclusions: The water dispersibility of poorly water-soluble polyphenols curcumin and quercetin was improved by the complexation with casein and casein Hydrolysate. The complex between polyphenols and casein or casein hydrolysate was confirmed to be present as a hydrocolloidal material in aqueous media.

Key words:polyphenol; curcumin; quercetin; solubility; peptide

STUDY OF ENZYMATIC HYDROLYSIS OF MICROALGAE PROTEIN ISOLATE

M. Verdugo[1], M.Rubilar[2]

[1]Program in Sciences of Natural Resources,Universidad de La Frontera, Temuco, Chile

[2]Center of Food Biotechnology and Bioseparations, BIOREN, Universidad de La Frontera, Temuco, Chile

Background and objectives: Recently, bioactive peptides from enzymatic hydrolysis of various food proteins have been reported; however there are few publications related to peptides from microalgae residual cake. Until now the applications of microalgae are as nutritional supplements, natural dyes, and skin care products, but there is no study reporting derived peptides of Nanochloropsis gaditana residual cake with antioxidant activity. In this work, the objective was study the Nanochloropsis gaditana protein hydrolysis as source of antioxidant peptides.

Methods: Preliminarily the influence of the various proteolytic proteases on the hydrolysis of protein isolate was evaluated using proteinase K, trypsin and papain. In this case, papain was used for the optimization study as it showed the highest hydrolysis degree and antioxidant activity in the preliminary screening. Afterwards, the enzymatic hydrolysis using papain, was optimized by factorial design, considered factors were enzyme/substrate ratio, time and temperature of hydrolysis.

Results: The F-test and p-value indicated that the effect of temperature was the most significant on the hydrolysis degree, followed by time. Besides, Pareto chart demonstrated that these factors were the only statistically significant (p-value < 0.05). Finally optimal conditions for the bioactive peptides production were found at 47.5 ºC, 90 min and enzyme/substrate ratio of 0.08 Hub/mg, under which degree of hydrolysis was 65%. Finally, these results demonstrated that Nanochloropsis gaditana protein isolate was effectively hydrolyzed by papain to produce hydrolysates with a high degree of hydrolysis, and antioxidant activity.

Conclusions: These results show that microalga protein hydrolysate could be a promising source of antioxidant peptides. Author acknowledges the financial support given by Conicyt through Conicyt scholarship Nº 21070302 and Nº 24110191, Consortium Desert Bioenergy S.A. for research and development of biofuel industry from microalgae, INNOVA Chile-CORFO 09CTEI-6860, Program "Microalgae biomass for production of bio-compounds", Dirección de Investigación at Universidad de La Frontera and DI10-2016.

Key words: microalga, protein, hydrolysis.

IDENTIFICATION OF FRUCTANASES WITH POTENTIAL APPLICATION IN THE FRUCTOOLIGOSACCHARIDES PRODUCTION.

A. Ávila-Fernández[1], A. López-Munguía[2]

[1]Centro de Investigación, División Académica de Ciencias de la Salud, Universidad Juárez Autónoma de Tabasco, Tabasco, México

[2]Instituto de Biotecnología, UNAM, Cuernavaca, México

Background and objectives:b2-1 fructooligosaccharides (FOS) are complex sugars and their prebiotic properties has been widely reported. b2-1 FOS may be directly synthesized from sucrose using fungal fructosyltransferases or by partial enzymatic hydrolysis from plant inulin through enzymatic hydrolysis using microbial endoinulinases.Another sources to produce FOS are the branched inulins and levans containing different proportions of b2-1 and b2-6 linkages in their structures. These are available in plants and microorganisms.Due to their complex structures, the identification and characterization of novel fructanases (endoinulinases and endolevanases)

which can perform an efficient partial hydrolysis is required. In this work, the identification of some potential fructanases from the sequences reported in database using bioinformatic tools is described.

Methods:A preselection of 200 sequences was performed from the sequences reported in GenBank with hypothetical inulinase, levanase, and hydrolase activity. In a second step, a multiple sequence analysis was developed in CLUSTALX. Sequences clustered in different clades were analyzed and their characteristics compared with the sequences whose biochemical characterization has been reported.

Results: According to their primary structure, selected sequences belong to the Glycoside Hydrolase family 32Five mayor clades were identified in the phylogenetic tree constructed from the CLUSTALX alignment. Three enzymes with proven fructanase activity (endolevanase and levanbiohydrolase) were identified in 3 different clades. So, it is possible that sequences located at each clades encode for enzymes with the same kind of activity. In a more detailed analysis of the alignments some local differences probably involved in the specificity of the enzyme were identified. Based on the differences 6 sequences were selected from the database to be tested experimentally.

Conclusions: Six hypothetical fructanases were identified from database using bioinformatic tools,which were essentials to refine the search.This work was supported by PFICA-UJAT-2012- C01.

Key words: Fructanase, prebiotics, FOS, inulinase, endolevanase.

PO2980

EFFECT OF PUERARIN ON THE INSULIN SIGNALING PATHWAY IN TYPE 2 DIABETIC RAT MODEL

X. Xuesong[1], Y. Yuexin[1], W. Zhu[1], R. Shuang[1]

[1]National Institute For Nutrition and Food Safety, Chinese CDC, China

Background and objectives: £ºPuerarin, a major active isoflavone extracted from the traditional Chinese medicine Radix Puerariae, has been studied for its comprehensive biological actions. However, its effect on insulin signal transduction in diatetic rats has not been well investigated. In the present study, we explored the effect of puerarin on insulin receptor (IR), insulin receptor substrate-1 (IRS-1), Peroxisome proliferator-activated receptor-α (PPAR-α), and Nuclear factor-kB (NF-κB) in Type 2 diabetic rat model.

Methods: 48 rats with type 2 diabetes were selected and then randomly assigned to low dose of puerarin (50mg/kg), middle dose of puerarin (100mg/kg), high dose of puerarin (200mg/kg), or distilled water. Each group continued on their original diets for 5 weeks. Five weeks later, the body weight and Blood biochemical indices were carried out. The pancreatic, kidney, liver and heart tissues were stained with hemotoxylin and erosin. The expressions of InsR, IRS, PPAR-α, and NF-κB were examined by Western blot method.

Results: Compared with the diabetic control group, puerarin could reduce the levels of FBG and PBG in diabetic rats, improve the ISI, improve liver and kidney function, and had dose-response relationship ($p < 0.05$). Puerarin inhibited the expression of NF-κB in peripheral tissue (liver, muscle) and increased the expressions of IRS-2 and PPAR-α.

Conclusions: Puerarin could improve insulin signal transduction, its hypoglycemic effect might be related to raising the level of antioxidant, as well as inhibition the expression of NF-κB in inflammatory signaling pathway.

Key words: puerarin; type 2 diabetes-insulin signal transduction.

PO2981

SUPPRESSIVE EFFECT OF HYDROLYZED RICE BRAN (HRB) ON D-GALACTOSAMINE/LPS INDUCED IL-18 AND HEPATITIS BY INHIBITION OF NF-κB PATHWAY IN MICE

Y. Egashira[1], M. Hanaki[1], S. Hirai[1], X. Zhu[2], N. Igari[2]

[1]Laboratory of Food Nutrition, Graduate School of Horticulture, Chiba University, Matsudo, Chiba, Japan

[2]Daiwa-pharmaceutical Co,Ltd., Setagaya, Tokyo, Japan

Background and objectives: Hepatitis is a serious health problem worldwide associated with significant morbidity. D-Galactosamine (GalN) /LPS induces acute hepatitis in mice. Hydrolyzed rice bran (HRB) is a modified water soluble arabinoxylan from rice bran that can be obtained by partial hydrolysis with carbohydrate-hydrolyzing enzymes from shiitake mushrooms. However, the effects of HRB on GalN/LPS induced hepatitis have not yet been clarified. In this study, we investigated the effect of HRB on GalN/LPS-induced hepatitis in mice.

Methods: Male ddY mice (6-wl-old) were fed a diet containing 0, 6 or 60 mg% HRB for 1 week. On the last day, the mice were treated with GalN/LPS and 6 h later the mice were killed. The serum transaminase activities were determined by a Transaminase C-test Wako kit. Serum IL-18 concentration and hepatic IL-18 mRNA expression were analyzed by ELISA kit and real-time PCR, respectively. To determine whether the inhibitory action of HRB was due to its effect on IkBa degradation, the cytoplasmic levels of IkBa protein were measured by western blot analysis.

Results: The dose of 6 mg% HRB was found to significantly alleviate the increase of serum AST activity and IL-18 concentration in GalN/LPS-intoxicated mice. The significant increase of AST activity was found to be accompanied with the elevation of hepatic IL-18 mRNA expression and serum IL-18 concentration. Furthermore, HRB abrogated IkBa degradation induced by GalN/LPS, and this was associated with the inhibition of NF-kB activation.

Conclusions: These results showed that HRB could provide a significant protection against GalN/LPS induced hepatitis, and IL-18 and inhibition of NF-kB pathway might be involved in the protective influence of HRB.

Key words: Rice bran, Hepatitis, IL-18, Arabinoxylan, Cytokine

PO2982

DIETARY POLYPHENOLS INDUCE A SECRETION OF GUT HORMONES FROM CACO-2 CELLS

W Y. Song[1], Y. Aihara[1], T. Hashimoto[1], K. Kanazawa[1]

[1]Department of Agrobioscience, Graduate School of Agricultural Science, Kobe University, Japan

Background and objectives: Gut hormones are produced at epithelia of intestine in the response of a food intake. These hormones control the body in several levels by regulating appetite at brain, gut motility, and also insulin secretion. Some dietary polyphenols in plants are noticed by their functionality to improve diabetes through amelioration of blood glucose level. To investigate a link between polyphenols and gut hormones secretion, we performed in vitro analysis using human epithelial intestinal cell line (Caco-2).

Methods: First, Caco-2 cells were supplemented with eight kinds of catechins and compared the secretion of gut hormones; glucagon-like peptide-1 (GLP-1), peptide YY (PYY) and cholecystokinin (CCK).

Results: Catechins constituted with gallate ester induced secretions of gut hormones, whereas simple catechins didn't. Among them, epigallocatechin gallate and gallocatechin gallate were effective to induce secretion of all the three hormones. Epicatechin gallate and catechin gallate induced secretion of CCK, but not GLP-1 nor PYY. Then we measured also the secretion of GLP-1 with the addition of cyanidin, delphinidin, kaemferol, miricetin and naringenin. Though weaker than gallocatechin gallate, delphinidin, cyanidin and kaemferol induced GLP-1 secretion by this order. Myricetin and naringenin didn't show any inducible effect on GLP-1 secretion.

Conclusions: These results suggest that flavonoids of non-planar conformation and saturated bond at 2, 3 position can induce peptide hormone secretions, thus may modify the blood glucose level.

Key words: flavonoid, gut hormone, Caco-2

PO2983

BIO-ACTIVE COMPOUNDS OF FAGONIA ARABICA IN RELATION TO THEIR PHYSIOLOGICAL FUNCTIONS

A. Hussain[1], H. Rathore[2], M. Zubaid[2], S. Chatha[1], M. Arshad[3]

[1]Government College University Faisalabad, Pakistan

[2]School of Pharmaceutical Sciences, Universiti Sains Malaysia, Penang, Malaysia

[3]Institute of Food Science, Government College University Faisalabad, Pakistan

Background and objectives: The aim of the present study was to quantify phenolic acids and flavonoids from Fagonia arabica (FA) extracts and to evaluate its antioxidant potential.

Methods: Aerial parts of FA were powdered and extracted with hexane and ethanol. Reverse phase high performance liquid chromatography method was developed and validated for the simultaneous quantification of phenolic acids and flavonoids from different FA extracts. The antioxidant activity of FA extracts was investigated by measuring total phenolics, total flavonoids contents, DPPH radical scavenging activity, inhibition of linoleic acid peroxidation and reducing power. The potent fraction of extracts was fed to Wistar Kyoto (WKY) rats, followed by carbon tetrachloride (CCl4), and the levels of superoxide dismutase (SOD), nitric oxide (NO), reduced glutathione (GSH), lipid peroxidation and total antioxidant capacity (T-AOC) were studied.

Results: The RP-HPLC analysis of FA extracts revealed the presence of ferulic acid, vanillic acid, p-coumeric acid, gallic acid, p-hydroxy benzoic acid and chlorogenic acid being the major phenolic acids and quercetin, myricetin and catechin being the most prominent flavonoids compounds. The amounts of TP (0.43-6.39 mg/g of dry plant material, measured as gallic acid equivalent) and TF (0.39-2.36 mg/g of dry plant material, measured as catechin equivalent) were higher in ethanol fraction. Ethanol fractions of FA also exhibited the highest antioxidant and DPPH radical scavenging activities. CCl4 decreased levels of GSH, SOD, NO and increased the formation of malondialdehyde (MDA) in untreated positive control animals. FA extracts increased the levels of GSH, SOD and decreased lipid peroxidation.

Conclusions: These results showed that the antioxidant and radical scavenging activities of FA may be responsible for its therapeutic effect. Owing to this property, the FA can be further extended to exploit, its application for various health benefits as nutraceutical and food additive.

Key words: Quercetin, Free radical scavenging, Functional food

PO2984

ENHANCED PRODUCTION OF TESTOSTERONE BY GERANYLGERANIOL IN MOUSE TESTIS DERIVED TUMOR CELLS

H. Shirakawa[1], R. Yoshida[1], A. Ito[1], P. Giriwono[1], T. Goto[1], M. Komai[1]

[1]Graduate School of Agricultural Science, Tohoku University, Sendai, Japan

Background and objectives: Geranylgeraniol (GGOH) is a natural isoprenoid occurring virtually in all dietary sources which possess the mevalonate pathway, including rice. However, rich sources of GGOH include Bixa orellana commonly known for its annatto food colorant which has been used abundantly in many forms of food for daily consumption. GGOH is known to show diverse effects; induction of apoptosis in tumor cells and differentiation of osteoblast cells. We previously observed that dietary supplementation of GGOH suppresses lipopolysaccharide-induced inflammation in rats (1). In this study, we examined the supplementation of GGOH on steroidogenesis in testis Leydig cell-like tumor cells.

Methods: Mouse testis-derived tumor cells, I-10, were treated with GGOH, and the levels of testosterone and progesterone in cultured medium were measured by ELISA at several time points. Protein levels of steroidogenic factors, PKA, CREB, StAR, and CYP11a, were measured by western blot. And the effect of inhibitors for PKA (H89) and adenylate cyclase (MDL12,330A) on steroidogenesis stimulation by GGOH were analyzed.

Results: GGOH treatment significantly enhanced testosterone levels in cultured medium in dose-dependent manner at 0 to 30 microM. Progesterone levels in cultured medium were also increased by GGOH treatment. Western blot analysis revealed that GGOH enhanced the level of phosphorylated PKA. The treatment of H89 abolished stimulation of steroidogenesis by GGOH.

Conclusions: These results indicated that GGOH enhances testosterone production in I-10 cells via PKA activation.(1) Giriwono PE., et al., Eur. J. Nutr., in press.

Key words: geranylgeraniol, testosterone, steroidogenesis, protein kinase A

MECHANISTIC STUDIES OF ADVANCED GLYCATION ENDPRODUCTS INHIBITION BY DIETARY SPICY INGREDIENT CAPSAICIN

C H. Wu[1], S M. Hsia[1]

[1]School of Nutrition and Health Sciences, Taipei Medical University, Taiwan

Background and objectives: Diabetes is a life-long disease marked by elevated blood sugar levels.A significant factor associated with hyperglycemia is the resultant nonenzymatic glycation of biological proteins, with the irreversible formation of advanced glycation endproducts (AGEs).The current study was aim to evaluate the effects of capsacin, an active component of chili peppers, on AGEs formation.

Methods: Individual stage of protein glycation were evaluated using the model systems of £-gluconolactone assay (early stage), BSA-methylglyoxal assay (middle stage), and BSA-glucose assay (last stage), and G.K. peptide-ribose assay (protein crosslinking).In addition, phenyl-tert-butyl-nitron served as a spin-trapping agent, and electron spin resonance (ESR) was used to explore the possible mechanism of the inhibitory effect of capsaicin on glycation.The in vivo verification of antiglycation, antioxidant and anti-inflammatory capacities was examined by 12-weeks of capsaicin administration in streptozotocin-diabetic rats.

Results: In vitro glycation assays demonstrated that capsaicin exerted inhibitory effects on the glycation reaction and its subsequent crosslinking.Dual action mechanisms, namely antioxidant and reactive carbonyl trapping activities, may contribute to its antiglycation effect.In vivo, capsaicin reduced tissue AGEs accumulation, tail collagen crosslinking and concentrations of plasma glycated albumin.Levels of oxidative and inflammatory biomarkers were also significantly decreased in capsaicin-treated groups when compared with the diabetic group.

Conclusions: These data suggest that capsaicin supplementation may reduce the burden of AGEs in diabetics and may prevent resulting complications.

PO2986

OCCURRENCE OF FOOD-DERIVED PEPTIDES IN HUMAN PERIPHERAL BLOOD IN MICRO M LEVELS FOR FEW HOURS

K. Sato[1], K. Iwai[1], Y. Shigemura[1], K. Kimura[1]

[1]Kyoto Prefectural University, Shimogamo Hangi-cho, Kyoto, Japan

Background and objectives: It has been demonstrated that ingestion of food proteins and their enzymatic hydrolysates show beneficial effects beyond the established nutritional value. Many active peptides have been apparently identified by activity-guided fractionation. However, recent LC-MS/MS analyses have revealed very low levels of the active peptide in human blood (pM-nM). Then doubt has been casted to the suggested efficacy of food peptides. However, most of the active peptides have been identified by in vitro assays without considering bioavailability. Some peptides, which are not active in food, might be converted to active form during digestion and absorption process. Although these peptides could be absorbed into circulation system and exert biological activity in body, they have been overlooked. The objective of the present study was to identify and quantify food-derived peptides in human blood.

Methods: Peptides in human plasma were extracted with 75% ethanol and fractionated by size exclusion chromatography (SEC). The peptides in SEC fractions were derivatized with AccQ or PITC and the resultant derivatives were resolved by reversed-phase HPLC. The primary structure of the derivatives was determined by ESI-MS/MS or Edman degradation methods, respectively.

Results: Specific peptides such as Pro-Hyp, Pro-Gly, and Glu-Leu were detected in human blood 30–120 min after ingestion of enzymatic hydrolysates of collagen, elastin, and soy protein isolate, respectively. While the contents of these peptides depended on structure, they reached to micro M levels.

Conclusions: After ingestion of enzymatic hydrolysates of food proteins, some specific food-derived peptides are circulating in human peripheral blood, of which contents are extensively higher than the previous data on the "active peptides" identified by in vitro assays. The present study suggests that the food-derived peptides in human blood in higher content might be responsible for the biological activity.

Key words: peptide, bioavailability, blood.

PO2987

BIOAVAILABILITY AND METABOLISM OF (POLY) PHENOLS AFTER ACUTE CONSUMPTION OF A NOVEL ORANGE DRINK IN RATS

B. Escudero-López[1], L. Calani[2], M A. Ortega[1], A. Crozier[3], I. Cerrillo[1], S. Fernández-Pachón[1], D. del Rio[2]

[1]Department of Molecular Biology and Biochemistry Engineering, University of Pablo de Olavide, Sevilla, Spain

[2]The Laboratory of Phytochemicals in Physiology, Human Nutrition Unit, Department of Food Science, University of Parma, Parma, Italy

[3]School of Medicine, University of Glasgow, Glasgow, United Kingdom

Background and objectives: Phenolic compounds are secondary plant metabolites and their dietary intake is believed to be associated with beneficial health effects. A novel beverage based on fermented and pasteurized orange juice (FP-OJ) has been developed and the bioavailability and metabolism of its polyphenolic fraction has been investigated in a rat animal model.

Methods: Twenty-one Male Wistar rats were fed a single dose of 2 mL FP-OJ. Blood samples were taken at 0, 2, 6, 10, 24, 36, and 48 h and urinary samples were collected, at adequate intervals, up to 48 hours after FP-OJ ingestion. Biological samples were analyzed by means of UHPLC-MSn and all relevant metabolites have been identified and quantified.

Results: Eighteen phenolic compounds were identified in the beverage, of which 8 have been quantified. Among the 2.3 μmol of phenolics in the fed dose, the most relevant were hesperidin and ferulic acid hexoside. Five flavanone metabolites were identified in rat urine. In detail, naringenin and hesperetin metabolites in urine represented about 4.6 % and 0.5% of the total intake of naringenin and hesperetin, respectively. These metabolites reached the excretion peak within 6h after ingestion, with a complete clearance at 24h. Additionally, urinary dihydro-ferulic acid-sulfate and -glucuronide were identified for the first time, after consumption of a citrus-derived product. For these metabolites, the maximum urinary excretion was at 24h, in keeping with their generation in the colon by the resident microbiota. The calculated absorption (based on ferulic acid and hesperetin as putative precursors) was 26%. Only glucuronidated flavanones were identified in plasma samples, peaking -2h and returning to baseline levels after 24h.

Conclusions:FP-OJ flavonoids are bioavailable in rats, giving rise to a variety of metabolites that may circulate through the body for several hours after intake.

Key words: orange juice, flavonoids, bioavailability, colon microbiota, urinary excretion

PO2988

CHIA (SALVIA HISPANICA L.) FLOUR AS AN ALTERNATIVE INGREDIENT TO DEVELOP GLUTEN-FREE POTATO BREAD

B. Pereira1, B. Pereira[1], E. Cardoso[1], J. Mendonça[1], L. Sousa[1], M. Madeira[1], M. Reis[1], R. Miyahira[1], S. Freitas[1], K. Alencar[1], L. Bittencourt[1], R. Guimarães[1], M. Santos[1], L. Zago[1]

[1]University of Rio de Janeiro State, Brazil

Background and objectives: Chia seed has been used as an alternative ingredient in many products, i.e., gluten-free products. Furthermore chia has high nutritional and functional value due its composition in polyunsaturated fatty acids, protein, fiber, minerals and polyphenol coumponds. This study aimed to improve the nutritional properties of potato bread stuffed with ricotta and leek by adding chia flour.

Methods: A starchy base standard formulation (SF) was prepared as a control. Two experimental formulations were developed: gluten-free potato bread with 25% of chia flour (GFP25) and gluten-free potato bread with 50% of chia flour (GFP50). All formulations was analyzed in physical-chemical, microbiological and sensory aspects. Data was analyzed by Anova and Tukey test was performed ($p < 0.05$).

Results: Both control and experimental formulations met the microbiological standards of current legislation. We observed an increase in moisture content (SF: 48.61%; GFP25: 50.27% and GFP50: 50.47%), ash (SF: 1.66%; GFP25: 2.20% and GFP50: 2.56%) and lipids (SF: 7.50%; GFP25: 9.38% and GFP50: 10.41%) as the increase in the percentage of chia flour. The sensory analysis data indicate that the products were well accepted: GFP25 formulation presented the higher acceptability index (89%) compared to SF.

Conclusions: We concluded that our potato bread with chia flour could be an option of gluten-free products, constituting an alternative food for people who need a gluten-free diet, particularly, people with celiac disease.

Key words: functional food; chia; gluten-free products; sensory acceptance.

PO2989

LINGONBERRIES RETAIN BIOACTIVITY FOLLOWING SIMULATED GASTROINTESTINAL DIGESTION AND COLONIC FERMENTATION

C. Gill[1], E. Brown[1], G. McDougall[2], D. Stewart[2,5], G. Pereira-Caro[3], P. Allsopp[1], A. Crozier[3], I. Rowland[4]

[1]University of Ulster, Northem Ireland, UK
[2]James Hutton Institute, UK
[3]University of Glasgow, Glasgow, UK
[4]University of Reading, Reading, UK
[5]Heriot Watt University, UK

Background and objectives: Lingonberry (VacciniumvitisidaeaL) is a popular edible berry in Scandinavian countries and is increasing in popularity across Europe. Lingonberry possesses a complex polyphenolic profile consisting of a mixture of anthocyanins, phenolic acids, flavonols and proanthocyanidins which is of interest due to their putative anticancer activity.After consumption, phenolic compounds are subject to digestive conditions within the gastrointestinal tract which alter theirstructures and potentially their bioactivity. Given limited bioavailability in the small intestine, a substantial portion of berry phenolic compounds are likely to pass into the colon where they are degraded by the colonic microbiota. Therefore, it is reasonable to infer that the colonic epithelium is exposed to both the parent phenolic compounds and their degradation productsAimTo evaluate the impact of digestion and colonic fermentation on phenolic components and bioactivity of a lingonberry extract (LE).

Methods: LEs were produced by in vitro digestionand subsequent faecal fermentation and characterised by LC-MS and GC-MS. Bioactivity was tested using a physiologically relevant dose range (0-50 μg/ml phenols) with a 24 hour exposure inin vitro models representing key stages in colon carcinogenesis namely initiation (comet assay, HT29, mutagenicity assayHT-29G17neo) and invasion (Matrigel invasion assay, HT115).

Results: LC-MS and GC-MS analysis confirmed digestive and fermentation processes altered the polyphenol composition relative to the original LE with the levels of simple aromatic components increased in the fermented extract.Digested and fermented LEexhibited significant anti-genotoxic ($p< 0.05$), anti-mutagenic ($p< 0.05$) andanti-invasive ($p< 0.05$), effectscompared tothe appropriate controls (ANOVA, Post Hoc Dunnett T test)in all in vitro models.

Conclusions: This studyindicates that despite extensive structural modification following digestion and fermentation,lingonberry extracts retain their ability to modulate cellular processes associated with colon cancer.

Key words: Lingonberry, phenolics, fermentation, anticancer

PO2990

APPLICATION OF THE SOLVENT EXTRACTION TECHNIQUE TO INVESTIGATION OF ANTI-INFLAMMATORY ACTIVITY OF ADLAY BRAN

S M. Hsia[1], C H. Wu[1]

[1]School of Nutrition and Health Science, Taipei Medical University, Taiwan

Methods: In the present study, adlay bran (AB) was extracted with ethanol (ABE) or ethyl acetate (ABEa) and the anti-inflammatory effects were monitored using a system of lipopolysaccharide-stimulated RAW 264.7 macrophages. The extracts of ABE and ABEa were further separated into four fractions, respectively.

Results: The inhibitory effect of the ethyl acetate fraction of ABE (ABE-Ea) and ABEa (ABEa-Ea) on nitric oxide (NO) production were higher than those of other fractions, and their yields were 0.91% and 1.16% (wet weight based), respectively. Then, the ABE-Ea and ABEa-Ea were sub-fractionated into 30% Ea/n-hexane, 80% Ea/n-hexane, 100% Ea, and 95% ethanol by column chromatography. With the exception of the ABE-Ea-30% Ea/n-hexane sub-fraction, other sub-fractions expressed different inhibitory effects on NO production, the expression of inducible NO synthase and cyclooxygenase-2 protein, and the secretion of interleukin-6 and tumor necrosis factor-£\.

Conclusions: In conclusion, ABE-Ea and ABEa-Ea express anti-inflammatory properties, and the yield of ABEa-Ea was higher than that of ABE-Ea.

PO2991

AN IN VITRO INVESTIGATION INTO THE POTENTIAL PREBIOTIC ACTIVITY OF PSYLLIUM HUSKS

M. Chan[1], W. Cher[1]

[1]Newcastle University, Newcastle, UK

Background and objectives: Psyllium husks are derived from a plant known as Plantago ovata. Consumption of psyllium husks was shown to exhibit health benefits which include lowering plasma cholesterol levels and possible potential as a prebiotic ingredient. This project aimed to investigate the potential of psyllium husks as a prebiotic.

Methods: Single colony of Lactobacillus Casei and Escherichia Coli was inoculated into different nutrient mixture made up of 0.1% peptone water containing 0%, 0.10%, 0.50%, and 1.00% psyllium husks (w/v). Samples were incubated anaerobically at 37oC for 0, 2, and 5 days before plating on nutrient agars, supplemented with 1% lactose (w/v) in triplicates to observe changes in the number of colonies. A pH meter is used to measure the change in pH of the samples.

Results: Although colony counts of both Lactobacillus casei and Escherichia coli showed an increasing trend at higher concentrations of psyllium husks with longer incubation period, the increase in the number of colonies of Lactobacillus casei and Escherichia coli between day 0 and day 5 of incubation were insignificant ($p > 0.05$).

Conclusions: Our data suggested that although psyllium husks was not effective in stimulating the growth of probiotic bacteria such as Lactobacillus casei, the growth of non-probiotic bacteria such as Escherichia coli were augmented, albeit insignificantly. Therefore, psyllium husks' potential as a prebiotic ingredient could be further investigated.

Key words: Psyllium; Probiotic; Prebiotic

PO2992

EFFECT OF GARLIC ESSENTIAL OIL ON PROTEIN OXIDATION IN CHILL STORED PORK PATTIES

G. Nieto Martínez[1,2], L. Skibsted[2], M. Andersen[2], S. Jongberg[2], G. Ros[2]

[1]Departamento de tecnologia alimentos, Facultad de Veterinaria/ University of Murcia, Murcia, Spain
[2]Department of Food Science/ University of Copenhagen, Frederiksberg, Denmark

Background and objectives: Taking into accounts that meat products, such as burger patties, are very susceptible to oxidation as mincing, cooking, and addition of salt promotes the formation of Reactive oxygen species (ROS), the addition of natural antioxidants as essential oil on these meat products could be an interesting strategy to improve their quality. The aim of this study was to determine the effect of garlic (G) essential oil (EO) on protein oxidation in pork burgers manufactured without synthetic additives and stored under retail display conditions.

Methods: For that purpose 3 batches of pork burgers (minced to 5 mm and 2 % salt) were prepared: the control group C; G1 (Level 1: 0.05% EO); and G2 (Level 2: 0.4% EO). The patties were packed with modified atmosphere (70%O2: 20%CO2: 10% N2) (MAP), stored for up to 9 days at 4ºC. The oxidative stability was evaluated by the formation of myosin cross-links as analysed by SDS-PAGE, and protein thiol loss as analyzed spectrophotometrically after derivatisation with DTNB.

Results: Results showed that protein thiols were lost to yield myosin cross-links in the pork patties during storage. Garlic was found to promote protein oxidation, as seen by an extreme loss in thiol groups and highly elevated myosin cross-link formation, indicating that G interacts with the thiol groups of the myofibrillar proteins, and thus increases the cross-link formation in pork patties stored in oxygen containing packages.

Conclusions: This study shows that essential oils of garlic should be tested for prooxidant activity before to be used.

Key words: protein oxidation, map, garlic, patties, meat

PO2993

UNCOMPETITIVE INHIBITION OF D-PSICOSE ON SMALL INTESTINAL SUCRASE ACTIVITY IN THE RATS

K. Yamada[1], N. Fukushima[1], T. Nakai[1], R. Takayanagi[1]

[1]Laboratory of Biochemistry, Department of Applied Nutrition, Kagawa Nutrition University, Saitama, Japan

Background and objectives: Many sugar substitutes and a-glycosidase-inhibitors are developed as new type sweeteners for the lower increases in plasma glucose after consumption of sucrose or starch. D-psicose (a C-3 epimer of D-fructose) is a rare sugar present in small quantities in commercial mixtures of D-glucose and D-fructose obtained from the hydrolysis of sucrose or isomerization of D-glucose. It has been reported that D-psicose inhibits the small intestinal sucrase and maltase activities. However, the manner of inhibition on disaccharidases is not known clearly. The studies were conducted to assess kinetically the inhibitory effects of D-psicose on intestinal hydrolases using the brush border membranes from rat small intestine.

Methods: Male Wistar adult rats were used for the experiment. The brush border membranes were prepared from the upper and middle jejunum according to the method of Kessler et al. and stored at -20 °C until assay. The assay of disaccharidase activity was carried out according to the method of Dahlqvist et al. D-psicose was added to the assay system after addition of enzyme solution, to observe the inhibitory effects on disaccharidases.

Results: In the case of sucrase activity, the reaction velocity (V) plotted against substrate concentrations showed classic Michaelis-Menten kinetics and significant inhibition with increasing amounts of D-psicose. The identification of uncompetitive inhibition was based on Lineweaver- Burk analyses, which showed parallel lines for the different inhibitor concentrations. Maximum V (Vmax) decreased to 1/2(with 10mmol/L D-psicose) and 1/3(with 20mmol/L D-psicose). The apparent Ki was calculated to about 11 mmol/L from the Lineweaver-Burke plots. In the case of isomaltase, the reaction velocity (V) showed also classic Michaelis-Menten kinetics and significant inhibition with increasing amounts of D-psicose. The apparent Ki was calculated to about 23 mmol/L.

Conclusions: These results suggest that D-psicose inhibits intestinal sucrase activity in the uncompetitive manner and also inhibits isomaltase activity.

Key words: D-psicose, sucrase, isomaltase, small intestine

PO2994

ANTIOXIDANT AND HYPOLIPIDEMIC PROPERTIES OF GREEN TEA AND EGCG IN DYSLIPIDEMIC RAT

W. Widowati[1], H. Ratnawati[2], T. Mozef[3], D. Pujimulyani[4], T. Herlina[5]

[1]Maranatha Christian University, Indonesia
[2]Maranatha Christian University, Indonesia
[3]Research Center for Chemistry, Indonesian Institute of Sciences, Indonesia
[4]Mercu Buana University, Indonesia
[5]University of Padjadjaran, Indonesia

Background and objectives: Green tea which contain the major ofEGCGhavehigh antioxidant activity. Here, the objective is to investigate whether green tea extract and EGCG can protect from oxidative stress and have hypolipidemic activity in dyslipidemic rat.

Methods: The antioxidant activity was determined by using Superoxide Dismutase activity (SOD) and lipid peroxidation product of whole blood and lipid profile included cholesterol total, Low Density Lipoprotein (LDL), triglyceride, High Density Lipoprotein (HDL) of serum from dyslipidemic rat. Rats were given high cholesterol feedand cholic acid during ten weeks until rats suffer dyslipidemic. After rats suffered dyslipidemic, the high cholesterol feed and cholic acid were stopped and given green tean extract 450; 300; 150 mg/kg body weight daily, EGCG 15; 10; 5 mg/kg body weight daily, compared to rats were given vitamin E 60 mg/kg/BW; simvastatin2.7 mg/kg BW,probucol 30 mg/kg BW daily for 21 days (first treatment) and 42 days (second treatment), control (normal feed), positive control (dyslipidemic rat).

Results: Green tea extract and EGCG could lower cholesterol total, triglyceride, LDL MDA and increase HDL, SODwere comparable with simvastatin, probucol both for 21 days and 42 days treatment

Conclusions: Green tea extract and EGCG had antioxidant and hypolipidemic potency by in vivo assay on dyslipidemic rat.

Key words: dyslipidemic, hypolipidemic,green tea, EGCG, antioxidant,lipid profile

PO2995

MODULATING ROLE OF MORUS ALBA LEAVES ON THE GLYCEMIC INDEX AND GLYCEMIC LOAD OF SELECTED FOOD PRODUCTS - BIOACTIVE FOOD PROJECT

M. Czlapka-Matyasik[1], A. Kostrzewa-Tarnowska[1], M. Fejfer[1], J. Mierkiewicz[1], J. Jeszka[1]

[1]Department of Human Nutrition and Hygiene, Poznan University of Life Sciences, Poland

Background and objectives: Morus alba L. has been used for a long time in traditional medicine in the treatments of diabetes mellitusand bacterial infection. Moreover, found in the plant the polyphenolic compounds have proven anti-radical properties, which play an essential role in preventing many civilization diseases. In the studies the glycemic index and glycemic laod of the selected bioactive food products designed in the Project and enriched with Morus alba L. was assessed.

Methods: The glycemic index (GI) is a measure of the effect of carbohydrates on blood sugar levels. The GI ofa selected food was calculated using the area under2-hours blood glucose response curse obtained after the intake food portion with 50g of carbohydrates. In the study 15 healthy volunteers with BMI < 25 kg/m2 were participated.

Results: Most of the products enriched in Morus alba L. was characterized by significantly lower GI and glycemic load (GL) in comparison to their placebo correspondents. Simultaneously, both: bioactive and placebo products can be classified as high and medium- GI and GL products.

Conclusions: The results support the correctness of bioactive component choice and its appropriate dose in the products. Disconcerting seems to be the generally high IG and GL of studied products. It seems, decision about weekly portion of bioactive food products for further controlled clinical trial has to be well thought out.Financialy supported by the UE Project nr PO IG 01.01.02.00-061/09.

Key words: Morus alba Leaves, glycemic index, glycemic load, bioactive food

PO2996

THE ESTIMATION OF ANTIOXIDANT CAPACITY IN DAILY DIETARY INTAKE OF THE PATIENTS WITH 2 TYPE DIABETES MELLITUS-PILOT STUDY

M. Czlapka-Matyasik[1], A. Kostrzewa-Tarnowska[1], J. Mierkiewicz[1], M. Fejfer[1], J. Jeszka[1]

[1]Department of Human Nutrition and Hygiene, Poznan University of Life Sciences, Poland

Background and objectives: The oxidative stress in diabetes is induced by intensified glycooxidation processes, oxidant-antioxidant imbalance, and coexisting inflammation. The antioxidant food compounds, (flavonoids, polyphenols, carotenoids, anthocyans) have an impact on diabetes prevention, course of this disease and complications development mainly by capturing free radicals, prooxydation inhibition and cells protection from free radicals. The objective of this study was to assess the daily antioxidant capacity of the diet by calculating Oxygen Radical Absorbance Capacity (ORAC) in patients with 2 type of diabetes.

Methods: The study included 38 patients with diagnosed 2-type of diabetes. The ORAC of daily dietary intake was estimated using validated food frequency questionnaire (FFQ) with diversification for seasons. Dietary intake was assessed through a face-to-face interview. ORAC was calculated basing on available international databases.

Results: The average antioxidant capacity of the diet in patients with 2 type diabtes was 27605 umolTE/day. It was noticed that the antioxidant potential was significant higher in summer than in other seasons which is linked to wide availability of vegetables and fruits in seasons. Moreover percentile distribution of consumption, revealed that nearly one third of respondents characterized by a very low diet antioxidant capacity.

Conclusions: Intake of dietary antioxidants in patients with type 2 diabetes were found to be very diverse and demanding more extensive studies. Furthermore, it is suggested to increase intake of foods rich in antioxidant compounds, characterized by the low energy density.Financialy supported by the UE Project nr PO IG 01.01.02.00-061/09.

Key words: diabetes, antioxidant diet capacity, ORAC

PO2997

DIETARY SOY ISOFLAVONE DAIDZEIN LOWERED THE FOOD INTAKE, BODY WEIGHT AND BODY FAT IN FEMALE RAT WITH AND WITHOUT OVARIECTOMY

T. Kishida[1], T. Mizushige[1], Y. Osada-Ohtsu[1], S. Ishikawa[1], M. Nagamoto[1], K. Ebihara[1]

[1]Department of Biological Resources, Faculty of Agriculture, Ehime University, Japan

Background and objectives: Estrogens down-regulate eating behavior. Soy isoflavones are known to be estrogenic agents. We examined the effect of dietary administration of soy isoflavones daidzein and genistein on food intake, body weight gain and body fat in male, female and ovariectomized rats.

Methods: Male, female and OVX rats were given free access to either the control dietbased on AIN-76 or diets containing 150 mg per kg diet of daidzein, genistein or both of themfor 4 weeks.

Results: Dietary daidzein, but not genistein decreased food intake, body weight and body fat of female rats with or without ovariectomy. Estradiol administration decreased these parameters of male and ovariectomized rats. Dietary isoflavone did not affect uterine and didymus weight in spite that estradiol administration improve atrophy of uterine in ovariectomized rats and decreased didymus weight of male rats.

Conclusions: We appeared daidzein has female specific food intake decreasing effect. However, contrary to the hypothesis, the food intake decreasing effect of daidzein may not be a simple estrogenic effect because the effect of daidzein on food intake and the reproductive organs differed to the effect estrogen had on these factors.

Key words: Eating behavior; isoflavone; rat; estrogenic; sex specificity

PO3000

COGNITIVE AND MOOD EFFECTS OF ACUTE SUPPLEMENTATION WITH CONCORD PURPLE GRAPEJUICE IN HEALTHY ADULTS

C. Haskell[1], R. Stuart[1]

[1]Brain, Performance and Nutrition Research Centre, Department of Psychology, Northumbria University, Newcastle upon Tyne, UK

Background and objectives: Flavonoids found in berry fruits have been linked with a number of health benefits.Previous studies of purple grape juice have demonstrated improvement to memory in age-associated mild cognitive impairment following at least 12 weeks supplementation, as well as increased brain activation following 16 weeks intervention. Anthocyanin-rich berry extracts have also been observed to improve sustained attention when measured acutely but no studies to date have demonstrated acute cognitive effects of grape juice specifically.

Methods: This randomised, placebo-controlled, double-blind, balanced-crossover study,assessed the effects of 200ml concord purple grape juice in 20 healthy young adults. Computerised measures of cognitionand mood were completed at baseline and following a 20-min absorption period, chosen due to a peak in native anthocyanins at ~30 minutes post-ingestion.

Results:A significant increase in calm ratings and an improvement in speed of attentionwereobserved following concord purple grape juice. There were no effects on memory.

Conclusions: This finding demonstrates that a single serve of purple grape juice is able to significantly improve speed of attention and increase calmness when measured 20 minutes following consumption. This supports a previous demonstration of improved sustained attention following berry fruit, possibly implicating this as an anthocyanin effect, which account for 46% of the polyphenolic content of the grape juice administered. However, the phenolic acids, flavanols and flavonols also present are liable to play a role in any neurocognitive effects. These improvements observed in a small sample of healthy young adults suggest thatthe behavioural effects of concord grape juice warrant further investigation to ascertain peak dose and time effects as well as exploring the active compound(s) responsible for such effects.

PO3001

CONTROLLED RELEASE OF 5-METHYLTETRAHYDROFOLATE ENCAPSULATED IN MESOPORUS SILICA SUPPORTS CAPPED WITH "SACCHARIDES" UNDER GASTROINTESTINAL STIMULUS

É. Pérez-Esteve[1], J M. Barat[1], R. Martínez-Mañez[2,3]

[1]Grupo de Investigación e Innovación Alimentaria, Departamento de Tecnología de Alimentos, Universitat Politècnica de València, Valencia, Spain
[2]Centro de Reconocimiento Molecular y Desarrollo Tecnológico, Unidad Mixta Universitat Politècnica de València-Universitat de València, Valencia, Spain
[3]CIBER de Bioingeniería, Biomateriales y Nanomedicina (CIBER-BBN), Spain

Background and objectives: The purpose of this poster is to describe the development and testing of a theory-based, tailored web-delivered intervention for prevention of excessive weight gain in young adults using a community-based participatory research (CBPR) model.

Methods: Investigators from 14 universities in different states of the USA employed the PRECEDE-PROCEED process of CBPR process to identify and prioritize quality-of-life behavioral and environmental factors that influence weight gain in young adults (YA).These factors were assessed for the YEAH (Young adults Eating and Active for Health) intervention via focus groups, key informant interviews, quantitative surveys, and environmental audits, and results were used to guide the development of the intervention. YEAH was developed as a 10-week, web-based intervention with 19 interactive modules and nudges (stage-tailored messages) addressing issues highest-rated by YA:managing stress (time and sleep management,balancing relationships, and control of alcohol), improving eating behaviors (eating enjoyment, skills for choosing and assembling meals), incorporating physical activity, and managing weight with a non-diet approach.Nudges were developed to reinforce module content, cognitively tested, and sent 3 times/weekvia email.Participants were encouraged to set goals and track progress via YEAH's website. Anthropometric measurements, fruit and vegetable intake, physical activity, stress management, and sleep duration assessments occurred at baseline, post-intervention (10-weeks), and 15 months. Data were analyzed using PROC MIX, SAS.

Results:YA (n=1639, age=19.3±0.03 years,BMI=24.1±0.1, 66% female), who were non-nutrition/non-exercise science majors, were recruited and randomized, stratified by institution and gender into intervention (n=824) and control (n=815) with 58% retention through 15 months. Intervention participants had significant increases in vegetable intake, intentions for meal behaviors and decreases in percentage of energy from fat at 10-weeks.

Conclusions: Community involvement in the development and implementation of YEAH enhanced theintervention and increased the likelihood of a sustainable weight management program.This project was supported by National Research Initiative Grant 2009-55215-05460 from the USDA National Institute for Food and Agriculture.

Key words: young adult, obesity prevention

BEHAVIOR OF ASCORBIC ACID IN OLD RATS SUPPLEMENTED WITH ASCORBIC ACID

A. Isaka[1], M. Taguchi[2], E. Suzuki[2]

[1]Ochanomizu University Human Life and Environmental Sciences Nutrition Nutrition and Food Science, Japan
[2]Ochanomizu University Humanities and Sciences Food and Nutritional Sciences, Japan

Background and objectives: Antioxidants are more needed to inhibit the effects of oxidative stress. L-Ascorbic Acid (AsA) known as vitamin C is a water-soluble biologically active antioxidant.AsA plays important roles as an oxidant.

Methods: Wistar male rats 10 weeks and 80 weeks old were used.Rats were intravenously given AsA (4mg/kg body weight) and blood and urine were collected over time. After 7 days of AsA supplementation, animals were dissected.

Results: The content of AsA in plasma, liver and kidneys of the 80 weeks old rats showed lower levels than that of the 10 weeks old rats. The content of Glutathione (GSH) in liver of the 80 weeks old rats showed lower levels than that of the 10 weeks old rats.At the AsA supplementation test, the concentration of AsA in plasma of the 80 weeks old rats showed lower levels than that of the 10 weeks old rats.The concentration of lipid peroxide level in the plasma of the 80 weeks old rats was higher than that of the 10 weeks old rats.L-gulono-ƒÁ-lactone oxidase (GLO) mRNA expression in the liver of the 80 weeks old rats was lower than that of the 10 weeks old rats.The level of Sodium dependent Vitamin C transporter1/2 (SVCT1/2), Glucose transporter 1 (GLUT1) mRNA expression in Liver and kidneys of the 80 weeks old rats was lower than that of the 10 weeks old rats.

Conclusions: From the results,it was suggested that the 80 weeks old rats were more susceptible to oxidative stress than the 10 weeks old. It was concluded that increasing age have effects on AsA metabolism of rats.

Key words:aging, L-Ascorbic Acid, vitamin C, supplementation

PO3003

AN INVESTIGATION INTO THE IMPACT OF PALMARIA PALMATA CONSUMPTION ON MARKERS OF INFLAMMATORY AND ANTIOXIDANT STATUS IN HEALTHY ADULTS.

P. Allsopp[1], E. Brown[1], C. Gill[1], P. Magee[1], S. Nitecki[1], W. Crowe[1], A. Soler[2], S. Strain[1], E. Mc Sorley[1]

[1]Northern Ireland Centre for Food and Health, University of Ulster, Cromore Road, Coleraine, Northern Ireland, UK
[2]Irish Seaweed Centre, Martin Ryan Institute, National University of Ireland, Galway, Ireland

Background and objectives: A vast quantity of in vitro research proposes beneficial antioxidant, anti-inflammatory and anti-hypertensive activities of seaweed, albeit few studies have investigated these in humans. Palmaria palmata is a popular seaweed snack in Northern Europe and Canada with putative health benefits being predominately based on anecdotal and in vitro evidence. This study aimed to investigate the effect of consuming Palmaria palmata on biomarkers of human health.

Methods: A four week randomised parallel placebo controlled human intervention trial was undertaken to investigate the influence of consuming Palmaria palmata (5 g/day) enriched bread (220g/d) on markers of inflammation (C-reactive protein – immunoturbidimetric assay) and antioxidant status (using the ferric reducing antioxidant power (FRAP) assay). Selected toxicological markers were also investigated (liver, kidney and thyroid function tests). Analysis of covariance (ANCOVA) (with baseline values as co-variates) was used to assess between group differences over time (time x treatment interaction effects) with controlling for age, sex, BMI and smoking status.

Results: The consumption of Palmaria palmata enriched bread (n 16) was shown to significantly increase mean (±SD) serum CRP (P=0.007) concentration (μg/dL) relative to placebo, with a change from 207.94 (± 306.89) at baseline to 241.3 (± 196.2) post-intervention. Palmaria palmata consumption (n 16) was also shown to increase mean (±SD) serum thyroid stimulating hormone (TSH) concentration (mIU) relative to the placebo group, with a change from 2.50 (± 0.82) at baseline to 2.93 (± 1.32) post-intervention. No significant changes were noted in liver and kidney function tests or antioxidant status in either placebo or treatment.

Conclusions: The results from thid human trial showed a pro-inflammatory effect of Palmaria palmata alongside altered thyroid function with significantly elevated TSH relative to control. More research is needed to elucidate the underlying mechanisms responsible for the changes apparent in this study, their potential long-term impact on health.

PO3004

EVALUATION OF COMPOSITION CHEMICAL, CAROTENOIDS AND BETA-GLUCAN CONTENT OF JATOBA-DO-CERRADO (HYMENAEA STIGNOCARPA MART.) OF THE BRAZILIAN SAVANNA.

C. Olivieri[1], C. Silva[1], T. Berner[1], M. Kowalski[1], R. Soares[1], J A. Arêas[1]

[1]Department of Nutrition, School of Public Health, University of Sao Paulo, USP, Sao Paulo, Brazil

Background and objectives: There are few studies about the nutritional value of the species of the savanna, considered one of the most interesting ecosystems in Brazil due to its extensive biodiversity, which leads to its underutilization. However, jatoba-do-cerrado, an abundant legume of the Brazilian savanna, may be a functional food due to its fiber content and low glycemic index. Therefore, jatoba-do-cerrado can be used to supplement foods, playing an important role in preventing chronic diseases such as diabetes. Besides that jatoba-do-cerrado stands out for serving for reforestation.The main objective of this study was to characterize this variety with a view to introducing it as a commercial raw material.

Methods: It was determined the proximate composition, amino acid profile, fatty acid profile, mineral, carotenoid antioxidants and beta-glucans content according to AOAC.

Results: The jatoba contains (g.100 g-1): moisture 12.8, proteins 7.0, lipids 1.2, insoluble fiber and soluble fiber 41.7 and 11.2, respectively, carbohydrates 23.0, ash 3.0 presenting as major minerals (mg.100 g-1): calcium 145, potassium 1352, phosphorus 107, manganese 16.78, magnesium 125, zinc 1.11 and iron 0.74The fatty acids profile showed 75.8 % of unsaturated and 24.2 % of saturated fatty acids. The amino acid profile presented some limiting amino acids, suggesting the need to combine this legume with other foods. Relative to carotenoid antioxidants, it has been found (ìg.100 g-1): lutein 279.78 and beta-carotene 16.90. And found a low content of beta-glucans (g.100 g-1) from 1.0.

Conclusions: The results point out that the jatoba has high levels of fibers, among these, however at low concentration, beta-glucans which are being studied, and important minerals, leading to a potential use in developing new products with features and benefits that promote health.

Key words: jatoba-do-cerrado, Brazilian savanna, proximate composition.

PO3005

PHYTOCHEMICAL CONTENTS, ANTIOXIDANT AND ACETYLCHOLINESTERASE INHIBITORY ACTIVITY OF PIDADA (SONNERATIA CASEOLARIS) FRUIT EXTRACT, AN EDIBLE MANGROVE FRUIT SPECIES

M F. Abu Bakar[1], S H. Ali Hassan[1]

[1]Universiti Malaysia Sabah, Malaysia

Background and objectives: Plant of Sonneratia caseolaris also known locally as 'Pidada' 'Berembang', 'Perepat' or 'Mangrove Apple' among Malaysian, produced an edible mangrove fruit species which can be found on tidal mud in mangroves area. This small 'green-apple-like-shape' fruit has a sour taste and usually eaten raw or added in cooking. This study was conducted to investigate the phytochemicals content (total phenolic, total flavonoid, total athocyanins and total carotenoid content), antioxidant activity and acetylcholinesterase inhibitory activity of unripe and ripe fruit of S. caseolaris.

Methods: Different parts of S. caseolari fruit (flesh and stem cap) were extracted using 80% methanol. Phytochemical contents were determined using standard spectrophotometric analysis. Meanwhile, antioxidant activity was determined using FRAP (ferric reducing antioxidant power), DPPH free radical scavenging assays and ABTS decolourization assays.

The acetylcholinesterase inhibitory activity was determined by enzyme inhibition method.

Results: The results showed that the total phenolics, total flavonoids and total carotenoid contents were higher in the flesh part of unripe fruit of S. caseolaris as compared to the others with the values of 67.67 ± 0.10 mg (gallic acid equivalent /g), 37.06 ± 0.30 mg (rutin equivalent /g) and 5.41± 0.10 mg (beta-carotene equivalent/100 g); respectively. No anthocyanins content was detected in both unripe and ripe of S. caseolaris (stemcap and flesh).The antioxidant and acetylcholinesterase inhibitory activity of S. Caseolaris were found higher in the flesh of unripe S. caseolaris as compared to other parts.

Conclusions: S. caseolaris fruit contained an acceptable amount of phytochemicals, antioxidants and acetylcholinesterase inhibition properties. Therefore, utilization and commercialization of this fruit as natural antioxidant and acetylcholinesterase inhibition sources could offer diverse opportunity for for pharmaceutical and nutraceutical applications.

Key words: Phytochemical, antioxidant, acetylcholinesterase inhibitor, pidada

PO3006

OPTIMIZATION OF MIX CONDITION WITH PUMPKIN, CORN SILK, AND ADZUKI BEAN FOR INHIBITION OF ADIPOCYTE DIFFERENIATION IN 3T3-L1 CELL

J. HeePark[1], R. YoungKim[2], E. Park[1]

[1]Department of Food and Nutrition Kyungnam Univ, 449 Woryeong-dong, Masanhappo-gu, Changwon, Gyeongnam, Republic of Korea
[2]Department of Hotel culinary and Bakery, Changsin College, Masanhoewon-gu, Changwon, Gyeongnam, Republic of Korea

Background and objectives: Obesity is important public concerns and there is increasing demand for effective therapeutic strategies. Pumpkin, corn silk, and adzuki bean have been used as traditional remediesagainst obesity in Korea. Therefore, the purpose of this study was to develop functional beverage using pumpkin (P), corn silk (C), and adzuki bean (A) with anti-obesity effect.

Method: The optimum formulation for mixing ingredients was achieved using response surface methodology (RSM), using a central composite design (CCD). A CCD was applied to investigate the mixing effects of independent variables, which included the P, C, and A, on dependent variables of glycerol and Oil Red O staining. The latter variables are biomarker for predicting inhibitory effect on 3T3-L1 adipogenesis.

Results: These data obtained from the assays fitted well in the each model as the lack-of-fit statistic was non-significant ($p>0.05$). The minimum lipid droplet formation (79.9%) by Oil Red O staining was found under the following experimental conditions: P = 100.8 μg/mL, C = 4.7 μg/mL, and A = 89.2 μg/mL, respectively. The maximum glycerol content (0.18 mM) was found under the conditions: P = 82.2 μg/mL, C = 5.9 μg/mL, and A = 58.4 μg/mL. To validate the optimized formula, the activities were compared with the experimental values. The optimal formula on lipid droplet formation was lower formation thanindividually treated P (100 μg/mL), C (10 μg/mL), and A (100 μg/mL). The optimal formula on released glycerol was higher release than individually treated samples.

Conclusion: Our data demonstrate that the developed two formulas strongly inhibit the adipocyte differentiation. Furthermore, these beverages might be used as a potential complementary treatment for the obese patients.

Key words: 3T3-L1 preadipocyte, adipocyte differentiation, response surface methodology, functional beverage

THE IMPACT OF THE NATURAL PHYTOESTROGENIC DIETOTHERAPYON SEX HORMONE METABOLISM IN MENOPAUSAL WOMEN AND RISK OF BREAST CANCER

A. Kostrzewa – Tarnowska[1], M. Czlapka – Matysik[1], M. Fejfer[1], J. Mierkiewicz[1], J. Jeszka[1]

[1]Department of Human Nutrition and Hygiene, Poznan University of Life Sciences, Poland

Background and objectives: Phytoestrogens arenon-steroidal plant-derived compoundswith strong antioxidant properties.Phytoestrogensthrough binding to estrogen receptors can induce significant estrogenic properties and play a role in alleviating thesymptoms of menopause and prevention of hormone-dependentcancers. The objective of this study was to investigate whether a diet rich in antioxidants would affect sex hormone metabolism and reduce the risk of breast cancer.

Methods: The study was conducted among 80 women in the perimenopausal period, who were characterized by an increased risk of hormone - dependent cancer. The nutritionalintervention with phytoestrogens enrichedproducts took 9 weeks. The energy, nutritive value and level of antioxidants indaily food rations were analyzed using the Wikt Pro computer program. Estrogen metabolites (2 OHE, 16-OHE1) were determined from 24-urine samples by ELISA method. The EMR index was calculated. Thetotal antioxidant capacity was measured.

Results: The nutritional intervention based on products enriched in phytoestrogens increases antioxidant capacity in human plasma (TAC). Moreover, the significant decrease of estrogen promoting the cancer (16-OHE1) and increase of the metabolite inhibiting carcinogenesis (2-OHE) were observed.

Simultaneously the studyalso indicated a significant increase of estrogen index (EMR).

Conclusions: It was concluded that the higher consumption of antioxidants, especially phytoestrogens, was correlated with higher total antioxidant capacity and a significant increase of the estrogen index which means reduction of the risk ofbreast cancer.

Key words:antioxidant capacity, phytoestrogens, hormone-dependent cancer, menopausal women

[3]Escola Superior Agrária, Instituto Politécnico de Santarém, Qta do Galinheiro, Santarém, Portugal
[4]Departamento de Botânica e Engenharia Biológica, Instituto Superior de Agronomia, Universidade Técnica de Lisboa, Tapada da Ajuda, Lisboa, Portugal

Berries are well recognized as polyphenols rich fruits, whose consumption bring benefits to human health. However, the significance of its dietary intake is not well known in particular in countries that doesn't have tradition of harvesting/consuming those fruits. In Portugal, a food frequency questionnaire highlighted that berries only represent 9% of fruit daily intake of Portuguese population, although assigning 17% of polyphenols daily ingested. Although being a considerable quantity of ingested polyphenols, for compounds to be effective they must be bioaccessible. Polyphenols after ingestion are extensively altered and their bioaccessible quantities limited. Then, studies that intend to clarify the beneficial effects of berry polyphenols should access those alterations and/or take them into consideration. An in vitro digestion model has been used to mimic gastrointestinal digestion, prior to test berries digested metabolites in in vitro cell models (from simple yeast to human cells). Berries tested in yeast strains ameliorate wild type response to oxidative stress and strawberry tree fruits, in particular, have the ability to rescue an oxidative-sensitive strain phenotype. A modulation of cellular defences, such as the glutathione balance, rather than a direct reactive oxygen species scavenging was verified. Similar protective mechanisms are mediated by blackberries digested metabolites in human cells submitted to oxidative stress. Those metabolites seem to exert a cytoprotective effect through the activation of preconditioning mechanisms, rather than direct antioxidant capacity. Finally, human interventions studies have also been conducted in order to determine the bioavailable metabolites from berries juice, their kinetics and range of physiological concentrations in human serum. Then, in future works bioavailable metabolites could be tested in cell models to study their mechanism of action on human body.

DEVELOPMENT OF A SWEET AND ENERGETIC BAR USING SESAME

M E. Sánchez-Pardo[1], E. Jiménez-García[1], A G. Tapia-Lara[1], M. Jiménez-Sánchez[2], E. Torres-Maravilla[1], J. Blancas-Nápoles[1]

[1]Instituto Politecnico Nacional, México
[2]Instituto de Tecnologico de Estudios Superiores de Monterrey, Nuevo León, México

Background and objectives: In Mexico, the sesame production is 1.3% and is used for preparing sweets, biscuits and confectionery in general. The aim of this work was to elaborate confectionery products whose main ingredient was the sesame.

Methods: The products were: hard candy added sesame and sesame energetic bar. The materials used were sesame, sucrose, citric acid, corn syrup, glucose, gelatin, water, and additives. The sesame evaluation was made based on the norm: NMX-FF-071-1994-SCFI. Non-industrialized products for human: use, oil, and sesame (Sesamum indicum l.). The chemical composition of sesame was 16.69 g/100 g protein, 50.90 g/100 g fat, crude fiber 15.70 g/100 g, 5.01 g/100 g ash, 12.76 g/100 g carbohydrates. The evaluation was conducted sesame toasting time, effect of temperature, the effect of added water, sugar substitute, effect of citric acid, in the crystalline state.

Results: Final formulation in 100 g solid: 23.67 g water; 35.51 g sucrose; 23.67 g glucose; 20 g roasted sesame, 0.47 g citric acid. The best sesame seed was stripped of its bark, the addition of glucose to the formulation was essential and established for the production of hard candy; citric acid was added to sesame hard candy, which was added at the end and in the crystalline state. In order to develop sesame energetic bar was

recommended the presence of amaranth. In addition required the presence of a mold release agent (wax paper thin), a bonding agent (starch gels in cold) a baking process to achieve a desirable texture. The effect of the size of final products is a feature to provide single servings. Of manufactured products found greater acceptance sesame bar.

Key words: Hard candy; energetic bar; sesame; citric acid; glucose.

EFFECT OF FEEDING OMANI HALWA ON THE GROWTH PERFORMANCE, BLOOD GLUCOSE AND PLASMA LIPID PROFILE OF SPRAGUE-DAWLEY RATS

A. Ali[1], A Z. Khalid[1], M. Waly[1], D. Sankar[1,2], E. Johnson[1,3]

[1]Department of Food Scienec and Nutrition, Sultan Qaboos University, Oman
[2]Department of Cardiovascular Diseases, Fukuoka University Chikushi Hospital, Japan
[3]Department of Animal and Veterinary Sciences, Sultan Qaboos University, Oman

Background and objectives: Omani halwa is a traditional sweet delicacy. We evaluated effect of feeding different levels of Omani halwa on growth performance, blood glucose, glycated hemoglobin (HbA1c) and plasma lipid profile of Sprague-dawley (SD) rats.

Methods: Forty-two male SD-rats of 4 weeks old were randomly divided into 7 groups containing 6 rats in each. Six experimental diets (in which normal rat chow was replaced with either white or black Omani halwa at 10, 15, and 20% level) were prepared and fed for 10 weeks. The group fed on rat chow acted as control. At the end rats were euthanized by cervical dislocation and blood (plasma) collected was analyzed for various biochemical parameters. Results: No significant ($P < 0.05$) differences were observed in feed consumption and growth rate of rats fed different levels and types of halwa as compared to control. The blood glucose level in rats fed different experimental diets did not vary ($P < 0.05$) as compared to control. The HbA1c values however differed significantly ($P < 0.05$) and the rats fed diets containing 20% of halwa showed significantly ($P < 0.05$) higher HbA1c values as compared to control group. Similarly rats fed diets containing 20% of halwa showed significantly ($P < 0.05$) higher TC and HDL-C values as compared to control. No significant ($P < 0.05$) differences were however observed in TG, LDL-C, and TC/HDL-C ratio of rats fed various experimental diets. The plasma creatinine levels differed significantly ($P < 0.05$) whereas plasma albumin levels did not differ ($P > 0.05$) in rats fed various experimental diets.

Conclusion: Feeding Omani halwa at 15% level did not affect the growth, blood glucose, HbA1c levels and lipid profile of rats.

Acknowledgement: Financial assistance was provided by SQU (IG/AGR/FOOD/01/11).

Key words: Omani halwa, feeding rats, blood glucose, HbA1c, lipid profile.

PO3386

MUSHROOM PROTEIN CONCENTRATES AS A PROTEIN SOURCE OF HIGH NUTRITIONAL VALUE

M. Díaz Herrero[1], P. Carbonero Aguilar[1], O. Creamades[2], L. Soares de Assunçäo[3], J. Bautista[1]

[1]Dpto. Bioquímica Y Biología Molecular. U Sevilla, Sevilla, Spain
[2]Escuela Universitaria de Osuna,Sevilla, Spain
[3]Universidad Federal de Viçosa, Brasil

Background and objectives: Nowadays is well accepted that a diet based in vegetable proteins is healthier than one based in animal proteins. Usually industrial protein concentrates are obtained by a wet procedure, i.e, protein extraction in alkaline solution and precipitation at its pI. This procedure implies a denaturalization of protein and loss of functional properties, and the reduction of other important functional products (polyphenols, vitamins, etc.). However, obtaining of protein concentrates by dry procedures (selective screening and elutration) allows obtaining products with 40-50% native proteins retaining main of the others functional compounds. In this work we present the characterization of mushroom protein concentrates obtained from industrial mushroom (Agaricus bisporus) by-products, by a dry procedure.

Methods: Mushroom were made into flour and fractionated by a dry procedure attaining four fractions: F-I, F-II, F-III and F-IV, which were analysed (humidity, ashes, proteins, carbohydrates, lipids, aminogram, solubility, water and oil retention.

Results: Mushroom flour (18.9%) has been concentrated by a dry procedure. Fractions F-III and F-IV present a protein concentration of 45.1% and 56.7%, respectively. F-IV amino acidic composition is well equilibrated (46.36 mg AEE/100 mg protein). This product can be used for the preparation of food product or formulas. The content in AEE covers the FAO and OMS recommendations for infants (45.6 mg AEE/ 100 mg protein), pre-schoolers (32.0 mg AEE/ 100 mg protein) and adults (11.1 mg /100mg protein).

Conclusion: The main advantage of this product is that the proteins conserve their native conformations retaining, practically, all its functional properties, and it conserves other functional products (polyphenol, vitamins, fibre…) constituting a good sources for the preparation of food products or formulas for young and old peoples.

Acknowledgements: This work was supported by funds from the Spanish Ministerio de Ciencia e Innovación and EU funds (FEDER) (Project: IPT-2011-1418-060000).

Key words: Mushroom, protein, high nutritional value.

PO3387

OLIVE LEAF BIOACTIVES: EXTRACT COMPOSITION, ABSORPTION AND METABOLIC EFFECTS IN HUMANS

S. Hodgkinson[1], M. de Bock[1], R. Schlothauer[2], W. Cutfield[1]

[1]Liggins Institute, University of Auckland, Australia
[2]Comvita New Zealand Ltd, Te Puke, New Zealand

Bacground and objectives: Studies of the metabolic benefits of bioactives in olive leaf (from Olea europaea L.) are confounded by research using virgin olive oil owing to the differing phenolic composition of the two sources. Objectives of the current study were: 1. To profile the bioactives in Olive Leaf Extract (OLE); 2. To examine the bioavailability of key bioactives in OLE and; 3. To determine effects of OLE on insulin-sensitivity (IS) in a population at risk of developing type two diabetes.

Methods and results: 1. Analysis of OLE phenolics revealed OL and hydroxytyrosol (HT) to be the major constituents (83.7% w/w and 12.4% w/w abundance respectively). 2.Volunteers received either encapsulated or liquid OLE as acute oral doses and plasma and urine samples collected. Conjugated metabolites of HT (sulphated and glucuronidated) were the major forms identified in plasma and urine. Peak OL concentrations were 15 – 20 fold lower than HT metabolites in plasma and greater following liquid than capsules (p=0.004). Similarly the time-to-peak conjugated HT concentration in plasma was shorter for liquid than capsules (93 vs 64 minutes; p=0.031). Conjugated HT species were the major forms identified in urine with >80% being cleared within 8hours. The data shows that OLE effectively delivers oleuropein and hydroxytyrosol metabolites to plasma in humans. 3. Effect of OLE on IS was determined using encapsulated OLE (51.1 mg oleuropein, 9.7 mg hydroxytyrosol per day) in middle-aged, overweight males using a 'gold-standard' trial design. Participants (n = 46) received capsules containing OLE or placebo for 12 weeks before washing out and crossing over to the other treatment. OLE supplementation was found to improve IS by 15% (p=0.024) and pancreatic β -cell responsiveness by 28% (p=0.013).

Conclusion: We conclude supplementation with OLE is a useful preventative treatment for those at risk of developing type 2 diabetes.

Key words: Olive leaf, oleuropein, hydroxytyrosol, insulin-sensitivity.

PO3388

TREATMENT WITH A SYNBIOTIC CONCEPT REDUCES ASTHMA-LIKE SYMPTOMS AND INDUCES REGULATORY RESPONSES IN A MURINE MODEL OF CHRONIC ALLERGIC ASTHMA

G. Folkerts[1], S. Sagar[1,2], M. Morgan[1], J. Garssen[1,2], N. Georgiou[1], A. Kraneveld[1], P. Vos[1,2]

[1]Utrecht Institute for Pharmaceutical Sciences, Faculty of Science, Utrecht University, Utrecht, The Netherlands
[2]Danone Research, Centre for Specialised Nutrition, Wageningen, The Netherlands

Background and objectives: Asthma is a chronic inflammatory disease affecting over 300 million people worldwide. Despite the effectiveness of the current treatments, over 50% of asthmatics are poorly controlled. This study explores the therapeutic effects of long-term treatment with a specific combination of Bifidobacterium breve M-16V and non-digestible oligosaccharides on asthma-like symptoms in a chronic allergic asthma model. Methods: Animals were sensitized (intraperitoneally) and challenged with ovalbumin (aerosol). After the first tree aerosol challenges, mice received saline or a synbiotic concept of Bifidobacterium breve M-16V, short- and long-chain fructo-oligosaccharides and pectin-derived acidic oligosaccharides by oral gavage and were challenged with ovalbumin tree times a week for one month. Pulmonary airway inflammation, Th-specific cytokines and transcription factors in lung tissue, mast cell degranulation, airway remodeling and other parameters were examined.

Results: B. breve M-16V and non-digestible oligosaccharides suppressed the influx of pulmonary eosinophils, but not macrophages, lymphocytes and neutrophils. Reduced levels of serum mouse mast cell protease-1 indicates a reduction in mucosal mast cell. The expression ratios of T cell transcription factors in lung tissue suggest that active treatment stimulates a regulatory T-cell phenotype, which is supported by the cytokine expression profile. In addition, the Foxp3 mean fluorescence intensity in blood CD4+ T cells was increased.

Conclusion: B. breve M-16V with non-digestible oligosaccharides, administered in a therapeutic way, has strong anti-inflammatory properties and induces regulatory responses in a chronic allergic asthma model. Interestingly, oral gavage with the concept leads to modulation of immune responses in the lungs, showing immunomodulatory effects that are not limited to the gastro-intestinal tract. This concept may be beneficial in the treatment of chronic asthma and/or allergic conditions.

Key words: B. breve M-16V, non-digestible oligosaccharides, allergy, therapy, immune response asthma and/or allergic conditions.

PO3389

LEAF CONCENTRATES; LOW COST NATURAL SUPPLEMENTS TO COMBAT MICRO NUTRIENT DEFICIENCIES

S. Sapur[1], J. Avvari[2]

[1]Akkshaya Foundation,Hyderabad, A.P, India
[2]Professor in Food and Nutrition, Dept of Home Science, Sri Padmavathi Mahila Viswa Vidyalayam, Tirupati, A.P, India

Background and objectives: The World Health organization has estimated the prevalence of clinical and sub clinical vitamin A deficiency in India is among the highest in the world. According to National Family Health Survey (NFHS), seventy three percent of Indian population suffers with anemia. Green leafy vegetables (GLV) are treasure trove of micronutrients but seasonal. Preservation of these GLV, ensures availability of nutrients round the year To preserve, develop nutrient dense leaf concentrates from seasonal GLV and to find out the appropriate dehydration method to minimize the nutrient losses.

Methods: seasonal locally available four GLV (piper betel,Murraya Koenigii,Trigonella foenum graecum, Mentha Spicata) were selected for the study, they were pretreated, blanched at 900C for 1 minute with magnesium oxide, and dried in solar cabinet driers which were with and without Ultra violet (UV) reduction filter. Time, temperature and yield of the leaf concentrate were noted. The leaf concentrates were analysed for carotene and iron content. Nutritionally dense traditional food products were developed using leaf concentrate, and organolepticaly evaluated.

Results: Carotene and iron concentration of leaf concentrates increased by 7 to 8 times in comparison with fresh green leafy vegetables. The nutrient and yield of the leaf concentrate was much higher from solar cabinet drier with UV reduction filter. The carotene content ranged from10821 - 14017µg/100g and iron content varied from 21.7mg- 88.1 mg/100gm. Statistical analysis of the organoleptic evaluation of traditional food items with leaf concentrate was excellent, (P value <0.1)

Conclusion: In developing countries multiple micronutrient deficiencies are common than single deficiency. The leaf concentrate powders can provide many micronutrients nutrients like carotene iron and others. Further research is needed to standardize dehydration technique with minimum nutrient losses and innovative ways to incorporate leaf concentrate in traditional foods.

Key words: Green leafy vegetables, leaf concentrate, micronutrient deficiency, solar driers.

PO3390

VITAMIN C FROM GUAVA CONSUMED WITH MUNGBEAN WITH MODEST NATIVE IRON INCREASES AVAILABLE IRON FOR ERYTHROPOIESIS AND HEMOGLOBIN BUT NOT IRON STORES

V. Rani[1,2], D. Moretti[3], N. Khetarpaul[1], M B. Zimmerman[2,3], S. Jood[1], I D. Brouwer[2]

[1]Department of Foods and Nutrition, Chaudhary Charan Singh Haryana Agricultural University, Hisar, India
[2]Division of Human Nutrition, Wageningen University, The Netherlands
[3]Department of Health Science and Technology, Institute of Food Nutrition and Health, Laboratory of Human Nutrition, ETH Zürich

Background and objectives: Consumption of modest native iron containing foods with vitamin C rich foods could be an effective strategy in improving iron status of schoolchildren. The study was aimed to assess the effect of mungbean based test meal with and without guava on iron status of rural schoolchildren

Methods: This study was conducted in Hisar district of Haryana State, North India. Mungbean based test meal i.e. mungdal and guava were analysed for energy, protein, fat, carbohydrate, iron, phytic acid, polyphenols and vitamin C. A randomized controlled, 7-mo, trial was conducted in 6–10-y-old schoolchildren (n = 200) who were randomly assigned to receive either a daily portion of mungdal alone (MB) or mungdal served with fresh guava(MBG). Average consumption amounts of mungdal and guava, height, weight, hemoglobin, soluble transferrin receptor, serum ferritin, α1-Acid glycoprotein and C-reactive protein were measured at baseline and at 7 mo.

Results: The molar ratio of iron and vitamin C served to MB group was 1:0.5 while for MBG group was 1:18. Providing guava with mungdal for 7 mo improved hemoglobin significantly by 3.7g/L (95% CIs: 1.6-5.6; P< 0.001) and reduces soluble transferrin receptors significantly by 7.6% (95% CIs: 2.1-12.7; P< 0.05) compared to mungdal alone. Though serum ferritin was improved in MBG however, this difference was not found to be significant (P= 0.34). MBG group had a non-significant change in body iron stores by 0.7 mg/kg of body weight (95% CIs: -0.3,1.6; P= 0.16), compared to MB.

Conclusion: Long term consumption of vitamin C (75g) from natural source (Guava) consumed with low iron (3.2 mg) meals reduces iron deficiency anaemia in schoolchildren. Absorbed iron is preferentially utilised to increase erythropoiesis over iron stores

Key words: Mungbean, guava, erythropoiesis, haemoglobin, children.

PO3391

AGRIMONIA PILOSA LEDEB. AQUEOUS EXTRACT IMPROVES IMPAIRED GLUCOSE TOLERANCE IN HIGH FAT FED RATS BY DECREASING HEPATIC INFLAMMATION

Y M. Lee[1], S Y. Nam[1], M J. Kim[1], Y S. Kim[1], H H. Jang[1], S M. Kim[1], H R. Kim1

[1]Rural Development Administration, Suwon, Republic of Korea

Background and objectives: The purpose of this study is to investigate the effects of aqueous extract from Agrimonia pilosa on impaired glucose metabolism induced by high fat diet in rats.

Methods: Male Sprague Dawley rats were assigned to the following groups (n=10): normal fat diet (NF); high fat diet (HF); high fat diet with 0.1% A. pilosa aqueous extract (HFA). Experimental diets were fed for 16 weeks. At the end of the treatment, liver was isolated and serum was collected for biochemical analysis.

Results: HF group had significantly increased liver weight compared with NF group by inhibiting hepatic lipid accumulation ($p<0.05$), however there was a significant decrease in liver weight by supplementation of A. pilosa aqueous extract. In oral glucose tolerance test at 15 week, we observed the blood glucose levels of the HFA group were lower than those of the HF group at 30, 60, 120 min after glucose administration ($p<0.05$). In addition, dietary A. pilosa aqueous extract increased serum adiponectin concentration compared with HF group ($p<0.05$). These effects of A. pilosa aqueous extract were accompanied by reduced hepatic expression of tumor necrosis factor-α, suppressor of cytokine signaling-3, interleukin-6, and interleukin-1β ($p<0.05$).

Conclusions: These data suggest that A. pilosa aqueous extract can improve insulin resistance in high fat fed rats by decreasing hepatic inflammation.

Acknowledgements: This study was carried out with the support of the Research Program for Agricultural Science & Technology Development (Project No. PJ00883902).

Key words: Agrimonia pilosa, insulin resistance, hepatic inflammation.

PO3392

LIVE-CELL IMAGING STUDY ON ANTI-ADIPOGENIC AND APOPTOTIC EFFECTS OF A POLYPHENOLIC RESVERATROL DURING ADIPOCYTE DIFFERENTIATION

H. Ihara[1], Ogawa. M[2], Y. Magata[2]

[1]Wakayama Medical University School of Medicine, Wakayama, Japan

[2]Medical photonics research center, Hamamatsu university school of medicine, Hamamatsu, Japan

Background and objectives: In the present study, using fluorescent live-cell imaging system, we demonstrate an apoptotic effects of resveratrol, a polyphenolic compound present in grapes and other foods, on adipocyte differentiation. We hypothesize that resveratrol inhibits adipocyte differentiation through an induction of apoptosis in early-stage cells of adipocyte conversion.

Methods: Adipocyte conversion and induction of apoptosis of 3T3-L1 cells were observed using fluorescent dyes, BODIPY and Alexa568-conjugated annexin V, respectively. Time-lapse cell imaging was performed using BioStation system (Nikon Tokyo), which consists of CO2 incubator incorporating fluorescent microscopy with CCD camera.

Results: Resveratrol treatments during differentiating stage induced apoptosis not in mature adipocytes but in early-stage cells of adipocyte conversion, which resulted in a dramatic inhibition of adipogenesis. Even in differentiated 3T3-L1 adipocytes (Day 6), mature adipocytes did not undergo apoptosis in response to 24 hr-treatments of resveratrol, whereas newly differentiating cells did. Next, we tried to elucidate anti-adipogenic effects of resveratrol in vivo, ob/ob mice were treated with resveratrol by daily oral administration (50 mg/kg B.W.). After 1-month treatment, 10% body weight loss was observed in these obese mice. Furthermore, CT scan before and after resveratrol administration showed that there were no clear regional differences in the reduction of adipose tissue mass, but abdominal subcutaneous adipose tissue seem to be reduced by these treatments.

Conclusions: These results suggest that resveratrol reduce adipose tissue mass in part through an induction of apoptosis in the early-stage cells of adipocyte differentiation.

Key words: Fluorescent live-cell imaging, apoptosis, adipocyte differentiation.

PO3393

A BIOLOGICAL SCREENING TEST TO DETERMINE THE ANTIOXIDANT POTENCIES OF WINE CONSTITUENTS

L. Dugo[1], F. Chiara[1], S. Grasso[1], M G. Belluomo[1], M. Dachà[1], E. Bergamini[2]

[1]Integrated Research Center, Università Campus Bio-Medico di Roma, Italy
[2]Research Center of Biology and Pathology of Aging, University of Pisa, Italy

Background and objectives: Several studies remarked the importance of consuming antioxidants-rich food in the daily diet. The beneficial effects rely on different phytochemicals, among which polyphenols. Many different methods have been reported for the in vitro study of antioxidant capacity of natural molecules. These are mainly chemical methods. Cell-based in vitro systems have also been reported. They might provide results on biological effects of molecules. We present a novel bioassay for the determination of food antioxidant potential using isolated red blood cell (RBC) membranes. The method was applied to test the protection effect of red wine samples against RBC membranes induced oxidative stress.

Methods: RBC membranes were isolated through filtration under vacuum of lysed erythrocytes. Isolated membranes were irradiated with UV-B light and malondialdehyde levels were measured as an indicator of lipid peroxidation. Red wine samples were characterized for phenolic composition and antioxidant activity by both Trolox Equivalent Antioxidant Capacity (TEAC) method and the RBC membranes bioassay.

Results: Total phenol content was estimated by Folin-Ciocalteu assay, total flavonoid and anthocyanin contents were determined by spectrophotometric methods. To classify red wine samples on the base of their chemical characteristic, principal component analysis was performed. The obtained score plot showed wines grouped in distinct clusters. Four wine samples dilutions were tested for the ability to protect isolated RBC membranes from UV-B-induced oxidation. Results showed a trend of protection, proportional to sample dilution and distinctive for each wine sample. Correlation analysis of results obtained from bioassay showed high coefficient values between antioxidant capacity and TEAC, total phenols and flavonoid levels. On the contrary, anthocyanin content seems to have no direct relation with antioxidant activity.

Conclusions: The isolated RBC membranes based bioassay represents an effective alternative to common chemical methods for determining the antioxidant potential of food matrices.

Key words: Antioxidant capacity, polyphenols, erythrocyte membranes.

PO3394

BIFIDOBACTERIUM BREVE TREATMENT IS AS EFFECTIVE AS BUDESONIDE AT REDUCING INFLAMMATION IN A MURINE MODEL OF CHRONIC ASTHMA

S. Sagar[1,2], M. Mary[1], P. Vos[2], J. Garssen[1,2], J. van Bergenhenegouwen[2], N. Georgiou[2], A. Kraneveld[1], G. Folkerts[1]

[1]UIPS, Division of Pharmacology, Faculty of Science, Utrecht University, The Netherlands

[2]Danone Research, Centre for Specialised Nutrition, Wageningen, The Netherlands

Background and objectives: Asthma is estimated to affect as many as 300 million people worldwide and its incidence and prevalence are rapidly increasing throughout the world, especially in children and within developing countries. Recently, there has been a growing interest in the use of potentially beneficial bacteria for allergic diseases. This study is aimed at exploring the therapeutic effects of long-term treatment with two different beneficial bacterial strains (Bifidobacterium breve and Lactobacillus rhamnosus) and a glucocorticoid (budesonide), as a reference treatment, on inflammatory response in a murine model for chronic allergic asthma.

Methods: To mimic the chronic disease in asthmatic patients, we used the murine ovalbumin-induced asthma model combined with prolonged allergen exposure. Airway function; pulmonary airway inflammation; airway remodelling, mRNA expression of pattern recognition receptors, Th-specific cytokines and transcription factors in lung tissue; mast cell degranulation; in vitro T cell activation; and expression of Foxp3 in blood Th cells were examined.

Results: Lactobacillus rhamnosus reduced lung resistance to a similar extent as budesonide treatment in chronically asthmatic mice. Pulmonary airway inflammation, mast cell degranulation, T cell activation and airway remodelling were suppressed by all treatments. Beneficial bacteria and budesonide differentially modulated the expression of toll-like receptors (TLRs), nod-like receptors (NLRs), cytokines and T cell transcription factors. Bifidobacterium breve was the most potent inducer of regulatory T cell responses, increasing Il10 and Foxp3 transcription in lung tissue and augmenting the mean fluorescence intensity of Foxp3 in blood CD4+ T cells. These observations suggest that Bifidobacterium breve is an inducer of regulatory T cell responses in the airways as well as systemic.

Conclusion: These findings show that Bifidobacterium breve has strong anti-inflammatory properties that are comparable to budesonide and therefore may be beneficial in the treatment of chronic asthma.

Key words: Probiotics, allergy, inflammation, immunology, airway function, therapy.

PO3395

BUCKWHEAT ENRICHED BREAD PRODUCTION AND ITS NUTRITIONAL BENEFITS

T. Bojnanska[1], C. Peter[2], D. Urminska[3], R. Gazar[1]

[1]Department of Storing and Processing Plant Products, Faculty of Biotechnology and Food Sciences, Slovak University of Agriculture In Nitra, Slovak Republic

[2]Department of Human Nutrition, Faculty of Agrobiology and Food Resources, Slovak University of Agriculture in Nitra, Slovak Republic

[3]Department of Biochemistry and Biotechnology, Faculty of Biotechnology and Food Sciences, Slovak University of Agriculture in Nitra, Slovak Republic

Background and objectives: Buckwheat is introduced into the diet as an alternative crop of renewed interest thanks to its nutritive and health-promoting value. Buckwheat grains and hull consist of some components with healing properties and biological activity (flavonoids, phenolic acid, phytosterols). The biological activities of flavonoids are related to their antioxidative effects.

Methods: A clinical study based on a daily consumption of 200 g of enriched bread (30 % buckwheat) was conducted on the group of 33 volunteers during a period of four weeks, after which the selected parameters in their blood were evaluated. Three intravenous blood samples were taken: before the clinical study, immediately after it and after another four-week period. The blood parameters (minerals, Mg, Fe, creatinine, urea, chloride, cholesterol, TAS, and triglyceride level) were measured by biochemical analyser.

Results: The daily consumption of buckwheat enriched bread (30 % buckwheat, 200 g bread, 3.8 g rutin) during the clinical study caused a significantly increased iron level in the blood of the volunteers and significantly decreased the triglyceride, HDL cholesterol, creatinine, calcium and magnesium level. The total cholesterol, urea and chloride levels decreased insignificantly. Data suggested that buckwheat was a significant antioxidant as TAS in human plasma and that the increased TAS level through doses of buckwheat bread could be useful as a free radical scavenger.

Conclusions: In general it can be concluded that the regular consumption of buckwheat enriched bread brings nutritional benefits to the consumers and with long-term consumption can have a protective effect thanks to the numerous nutraceutical compounds of buckwheat. Acknowledgements: The Paper was supported by the project: Development of International Cooperation for the Purpose of the Transfer and Implementation of Research and Development in Educational Programs conducted by the Operational Program: Education, ITMS code: 26110230085

Key words: Buckwheat enriched bread, antioxidants, biochemical blood parameters.

EFFECTS OF A FERMENTED TEA MANUFACTURED BY MIXING GREEN TEA LEAVES AND UNRIPE ORANGE ON LIPID METABOLISM IN RATS

K. Tanaka[1], H. Nakayama[1], N. Yuito[2], A. Okushima[1], Y. Miyata[2], Y. Miyata-Kuroda[2], Y. Nagata[2,3], S. Tamaru[2]

[1]Graduate School of Human Health Science, University of Nagasaki, Japan

[2]Faculty of Nursing and Nutrition, University of Nagasaki, Japan

[3]University and Government cooperation, Nagasaki University, Japan

Background and objectives: We manufactured a new fermented tea made with tea-rolling processing of green tea leaves and unripe orange. The fermented tea has good taste and good flavor. This tea extract contained a relatively high amount of hesperidin derived from unripe orange and black tea polyphenols generated from catechin in green tea leaves. In general, a water solubility of hesperidin is low, but hesperidin contained in this fermented tea has high water solubility, thus expecting high bioavailability. We examined effects of feeding the fermented tea on lipid metabolism in rats.

Methods: Third crop of green tea leaves and fresh unripe orange were mixed at a ratio of 3 to 1, kneaded with a tea roller at room temperature for 20 min, and dried by tea drier. We used freeze-dried powder of the fermented tea extract as a test sample. Male SD rats were fed a diet containing 0.5 or 0.75% sample powder for 4 weeks ad libitum. Next, the efficacy of feeding fermented tea on lipid metabolism was compared with green tea or unripe orange alone.

Results: Feeding fermented tea tended to decrease white adipose tissue weight and serum triacylglycerol concentration. This tea extract significantly and dose-dependently reduced liver triacylglycerol and cholesterol levels. Hepatic triacylglycerol-lowering activity of fermented tea was more potent than green tea and unripe orange.

Conclusions: We suggested that the new fermented tea manufactured by mixing green tea leaves and unripe orange exhibits hypotriacylglycerolemic properties through improving water-solubility of hesperidin.

Key words: Water-soluble hesperidin, unripe orange, green tea leaves, triacylglycerol, rats.

PO3397

IDENTIFICATION OF PHENOLIC COMPOUNDS BY LC-MS IN DRINKS OBTAINED BY GLUCONIC FERMENTATION FROM STRAWBERRY (FRAGARIA ANANASSA)

M A. Álvarez-Fernández[1], R. Hornedo-Ortega[1], P. Heredia del Orbe[1], A B. Cerezo[1], A M. Troncoso[1], M C. García-Parrilla[1]

[1]University of Sevilla, Food Science and Nutrition Departement, Sevilla, Spain

Background and objectives: Strawberry is very well-known as a rich source of bioactive compounds (polyphenols, vitamins, etc.), however, it is a very perishable fruit which frequently produce surplus every season. Thus, the use of strawberry to produce new products such as fermented beverages is an industrial alternative providing an economic worthwhile solution. Gluconic fermentation is a biotechnological alternative which transforms the glucose into gluconic acid, leaving unaltered the original fructose. Furthermore, fructose remains in the product to confer sweetness and its consumption is tolerated by diabetics. The aim of this work is to determine the polyphenolic profile of this fermented product to accomplish the description of its bioactive compounds which may exert healthy effects.

Methods: The samples used were strawberry purees fermented with Gluconobacter Japonicum. A total of six gluconic (n=6) fermentation was completed giving a total of 12 fermented products (n= 6 x 2 duplicates). We analysed the polyphenolic compounds by LC-MS/MS method.

Results: A total of 22 phenolic compounds were identified including phenolic acids, hydrocycinnamic acids, procyanidins, flavanols, tannins and stilbenes. Resveratrol and polydactin (resveratrol-glucoside) were identified for the first time in strawberry gluconic fermented product. Tannins compounds such as agrimoniin, sangin H10, HHP-galloyl glucoside and monogalloyl glucoside, described in strawberry, were still present in the product after the fermentation process.

Conclusions: The final products result in a rich source of bioactive compounds, being of interest from a nutritional and commercial perspective, especially for those consumers with dietary restrictions such as diabetics, who can benefit from a non-glucose drink with healthy properties.

Acknowledgements: We are grateful for the funding provided by the Spanish Government (Project MICINN AGL2010-22152-01), and to HUDISA Desarrollo Industrial S.A. (Spain), the University of Cordoba (Spain) and the University of Rovira i Virgili (Spain) for providing the samples.

Key words: Phenolic, strawberry, LC-MS/MS, fermented, gluconic.

PO3398

IMPROVEMENT OF FUNCTIONALITY OF RICE BY NEW FERMENTATION METHOD OF RED MOLD

E. Seo[1], Y J. Park[1]

[1]Department of Applied Bioscience, CHA University, Seongnam-si, Gyeonggi-do, Korea

Background and objectives: Red mold rice is a traditional oriental food and has been used as a healthy food. It has a bioactive compound such as monacolin K, which is reducing serum cholesterol level. Red mold rice is generally produced by solid state fermentation of Monascus strain and production of monacolin K depends on the type of fermentation system and cultivation conditions. In this study, red mold rice was produced in the new solid state fermentation system, roller bottle, which is compared to the general cultivation system, upright bottle.

Methods: Roller bottle system was developed for the solid state fermentation of red mold rice, modified from drum type bioreactor. Many glass bottles were laid down and rolled on the roller system. Monascus ruber KCTC 6122 was cultured in the liquid media for 3 days, and 8% (v/w) seed was inoculated to the autoclaved rice in the bottle. The inoculated rice was incubated at 25°C for 40 days, in the upright glass bottle and roller bottle, respectively. Results: Monacolin K content in the red mold rice produced in roller bottle system was as about 1.5 fold as that of in upright bottle system. The ratio of active form was similar to each other. Coefficient of variation was much smaller in roller bottle system than in upright bottle system, which means that the rice is fermented uniformly in roller bottle system.

Conclusions: The roller bottle culture system as a new solid state fermentation system was very useful to improve the functionality of rice and could be applied to a commercial production.

Key words: Rice, monacolin K, functionality, fermentation.

PO3399

INFLUENCE OF MODERATE RED WINE CONSUMPTION IN THE PREVENTION OF CARDIOVASCULAR DISEASES AND METABOLIC SYNDROME

P. Chlebo[1], U. Dana[2], T. Bojnanska[3], M. Gazarova[1], M. Schwarzova[1], P. Lenartova[1], S. Ailer[4]

[1]Department of Human Nutrition, Faculty of Agrobiology and Food Resources, Slovak University of Agriculture In Nitra, Slovak Republic

[3]Department of Storing and Processing Plant Products, Faculty of Agrobiology and Food Resources, Slovak University of Agriculture in Nitra, Slovak Republic
[4]Department of Fruit Production, Viniculture and Enology, Horticulture and Landscape Engineering Faculty, Slovak University of Agriculture in Nitra, Slovak Republic

Background and objectives: Epidemiological, experimental and clinical investigations have shown that diets supplemented with moderate quantities of alcoholic beverages lead to biochemical changes, that are widely regarded to prevent cardiovascular disease. Red wine contains a naturally rich sources of antioxidants which may protect the body from oxidative stress. We investigated the relationship between red wine intake and civilization diseases.

Methods: Research consisted of regular consumption of wine recommended doses according to predetermined conditions during the period of 6 weeks (7 days a week). It was attended by 11 women and 13 men aged 28-64 years. The consumption of wine has always conducted during dinner after a day abstinence. Dose of alcohol was determined to 200 ml red wine Lemberger (WINERY MASARYK, Slovakia). Consumed diet did not affect us in any way, the probands were without changing their eating habits and also without changing their lifestyle. We measured subjects blood pressure, anthropometric parameters and biochemical blood parameters.

Results: Daily intake of Lemberger during six weeks was associated with lower plasma levels of total cholesterol (5.66±1.12 vs 5.36±1.04), triglycerides (1.68±0.23 vs 1.47±0.66), LDL cholesterol (3.46±0.81 vs 3.26±0.76) and glucose (5.35±0.82 vs 5.26±0.78). On the contrary we recorded higher level of „good„ HDL cholesterol (1.42±0.63 vs 1.80±0.58). Systolic and diastolic blood pressure was also decreased.

Conclusions: Research results have shown that moderate consumption of red wine have a positive impact on changes of WHR index. Our study demonstrates a positive association between moderate wine consumption and risk of cardiovascular disease and metabolic syndrome.

PO3401

PROTECTIVE EFFECTS OF PHYTOESTROGENS LIKE DAIDZEIN AND GENISTEIN AGAINST OXIDATIVE STRESS IN THE CACO-2 COLON CARCINOMA CELLS

C. Suresh[1], V. Vijayalakshmi[1]

[1]National Institute of Nutrition, Hyderabad, India

Background and objectives: Colorectal cancer is one of the most common carcinomas observed in humans and it has been reported that increased oxidative stress is associated with human colorectal cancer. The objectives were to study the effects phytoestrogens such as daidzein (Dz) and genistein (Ge) on Caco-2 cell lines and the impact of exposure of these compounds on various antioxidant biomarkers were investigated.

Methods: The cells at a density of of 2 x 104 cells per well were allowed to grow initiatially for 24 hrs and then exposed to Dz (75 mM), Ge (75 mM) and to the combination of both Dz+Ge (50 mM) under controlled conditions for another 24 hrs. The effects of these compounds on oxidative stress parameters such as lipid peroxidation, catalase, superoxide dismutase, reduced glutathione and vitamin C were investigated Along with cell viability.

Results: In the unexposed cells MDA levels were significantly increased whereas other antioxidants such as reduced glutathione, catalase, superoxidxe dismutase and vitamin C were significantly decreased when compared to the exposed cells. The levels of MDA in the unexposed cells were 18.2 ± 0.165 nmol/ml where as in the cells exposed to Dz, Ge and combination of Dz and Ge were 11.26 ± 0.125, 12.56 ± 0.134 and 8.5 ± 0.186 respectively, showing a significant decrease in the levels. The glutathione, Catalase and Superoxide dismutase levels were significantly increased in the Dz, Ge and in combination when compared with unexposed cells. The results for the cell viability assay showed that viability was more in the unexposed group when compared to the groups exposed to Dz and Ge and the results were discussed in the present paper.

Conclusions: The obtained results show that combination of Daidzein and Genistein are efficient antiproliferative and antioxidant agents.

Key words: Genistein, daidzein, oxidative stress, Caco-2 cells.

PROTECTIVE EFFECT OF PERACETYLATED EGCG VS. EGCG ON ULTRAVIOLET-B INDUCED DAMAGE OF HACAT CELLS

H. Jiang[1], L. Dan[1,2], J. Zhang[1], W. Wang[1,2], J. Xue[1,2]

[1]Tea Research Institute, Chinese Academy of Agricultural Sciences, China

[2]Graduate School, Chinese Academy of Agricultural Sciences, China

(-)-Epigallocatechin-3-gallate (EGCG), known as the major ployphenol constitute in green tea catechins, possess significant photoprotective activities in cell culture, animal models and human skin. However, the active polyhydroxy structure of EGCG is responsible for the low bioavailability in physiological conditions. Peracetylated EGCG (AcEGCG), the product of molecular modification of EGCG, has shown higher biological stability and cancer-preventive activities in vivo and vitro, but it is still unclear whether AcEGCG can work as well as EGCG. Taken human keratinocyte cell line (HaCaT cells) as experiment materials in this paper, we investigated the effects of both EGCG and AcEGCG on UVB-induced reduction of cell viability and elevation of the levels of oxidative stress. Meanwhile, two administration strategies were performed including prevention mode (administrate agent before UVB exposure) and restoration mode (administrate agent after UVB exposure). Our results suggested that the adverse effects of UVB can be reversed by EGCG and AcEGCG in attenuating UVB-induced depression of cell viability and the activities of superoxide dismutase (SOD), glutathione peroxidase (GSH-Px) as well as inhibiting the production of malondialdehyde (MDA). Regarding the antioxidant effect of those two drugs in prevention mode and restoration mode, our data suggested that pretreatment of cells with agent prior to UVB irradiation was a more effective mode in comparison to another.

Key words: Peracetylated EGCG, EGCG, UVB, keratinocyte.

VITAMIN D DEFICIENCY OCCUR IN TROPICAL COUNTRY WOMEN, NOT DEPENDING ON ADIPOCYTE STATUS

D. Sari[1], H. Damanik[1], N. Lipoeto[2], Z. Lubis[3]

[1]Nutrition Department, Medical Faculty, University of Sumatera Utara, Medan, Sumatera Utara, Indonesia

[2]Department of Nutrition, Public Health Faculty, University of Sumatera Barat, Padang, Sumatera Barat, Indonesia

[3]Department of Food Science and Technology, Agriculture Faculty, University of Sumatera Utara, Medan, Sumatera Utara, Indonesia

Background and objectives: Low circulating 25-hydroxyvitamin D [25(OH)D] serum may increase risk of morbidity and mortality, especially in obese women and vitamin D deficiency are considered new markers for obesity and diabetes mellitus. We investigated whether deficiency vitamin D occur in normoweight and overweight-obese women who lived in abundant sunlight exposures area such Indonesia.

Methods: This was a cross-sectional study, we include healthy normoweight women subjects (n=41) and overweight-obese women with no other disease subjects (n=41), we investigated by ethnicity, age, sunlight exposure, way of dressed, using sunscreen, whitening, and nutrient intake. We included other parameters such systolic and diastolic pressure, Body Mass Index (BMI), waist circumference, fat distribution, 25-hydroxyvitamin D, and calcium serum.

Results: There are no different between two group in ethnicity, sunlight exposure, sunscreen and whitening using, and nutrient intake, but there are significant different in systolic (p=0.0012) and diastolic pressure (p=0.019), BMI (p=0.000), waist circumference (p=0.000), and fat distribution (p=0.000) between two group. Interestingly, there are no significant different in 25-hydroxyvitamin D (p=0.140) and calcium serum (p=0.464) between two group.

Conclusions: The results indicate that vitamin D deficiency can be found in tropical countries and there is no different between non-obese and obese women, and it is important to decide the requirement for different population. Many factors can influenced the deficiency such vitamin D intake and lifestyle to not avoid sunlight exposure to much. This should be attention in preventing diabetes mellitus.

Key words: vitamin D, adipocyte status, women.

PO3009

SURVEYS ON SELLING CONDITIONS, USE AND CONSUMPTION OF CRUDE PALM OIL IN DOUALA, CAMEROON

F F. Dongho Dongmo[1], A R. Ngono Ngane[1], I. Gouado[1]

[1]Department of Biochemistry, University of Douala, Douala, Cameroon

Background and objectives: Crude palm oil (CPO) is the richest known food in provitamin A. It is therefore very important to tackle vitamin A deficiency (VAD). However, populations do not always take precautions to maximize this potential. The objectives of this study were to identify some risk factors of carotenoids loss during the selling and the use in households of CPO and to evaluate its place in the fight against VAD in Cameroon.

Methods: We carried out three surveys in the town of Douala and its rural surroundings. The first consisted to collect information on selling conditions of CPO nearby 55 sellers. The second was made with 199 housewives in order to collect information on the use of CPO. The last carried out nearby 309 individuals and consisted in collecting information on the consumption of dishes prepared with unbleached CPO.

Results: It was noted that 87% of CPO sellers exposed oil to open air in spite that 44% knew that the sun could have a negative impact on oil quality. Light heating or exposure to sunlight was the methods used to liquefy oil. It was equally noted that 98% of household used CPO in both cold and hot made dishes. Moreover, 93% bleached oil although 64% knew its negative impact on oil quality. It was noted a significant influence (P<0.05) of social status of housewives on this result. We also noted that 87% of surveyed peoples consumed the dishes prepared with unbleached CPO with a significant influence (P<0.05) of life mode and origin Region.

E-Mail karger@karger.com
www.karger.com/anm

Conclusions: Sunlight and heating could be regarded as risk factors of loss of carotenoids in CPO in Cameroon. In spite of this, it could be used there to fight against VAD.

Key words: crude palm oil in Cameroon, carotenoids degradation, selling, cooking, consumption.

PO3010

CONSUMER PERCEPTION AND NUTRIENTS COMPOSITION OF SOME TRADITIONAL FOODS IN SOME AREAS IN ASHANTI REGION (KEDJETIA, ASAFO, TAFO AND MAAKRO)

E Y. Akoto[1], I. Oduro[1], W. Appau[1]

[1]Kwame Nkrumah University of Science and Technology, Kumasi, Ashanti Region, Ghana

Background and objectives: Traditional foods are often regarded as rich source of nutrients. However, foods indigenous to Ghana are characterized by low patronage in favour of exotic foods. Spreading 'nutrition knowledge' is sometimes necessary to improve consumer food behaviour.

Methods: A public survey was therefore conducted in Ashanti region to investigate the level of knowledge and attitude of people on consumption pattern of traditional foods in Ghana. Three traditional foods from the Ashanti region; 'apreprensa' (main meal), 'awiesu' (snack) and 'ntunkum (drink)', were selected based on their low level of availability and were analyzed for macronutrients (carbohydrate, protein, fat, ash, fibre and moisture) and minerals; Sodium (Na), Calcium (Ca), Phosphorus (P), Potassium (K) and Magnesium (Mg) using standard methods.

Results: Generally, respondents demonstrated high level of knowledge on traditional foods but low knowledge on their nutrients composition. The average consumption rate of traditional food was low (averagely 5 out of 200 respondents consumed the foods three times per week). There was a positive correlation (r=0.35) albeit weak, between consumer knowledge and attitude towards traditional foods. Respondents' demographic profile had significant effect (P=0.018) on level of knowledge on traditional foods.Results from the survey suggested that 'nutrition knowledge' is key but not sufficient factor for changing consumers' behaviour towards traditional foods in Ghana. The nutrients composition of 'apreprensa', 'awiesu' and 'ntunkum' also indicate that they are valuable in meeting macro- and micronutrient needs of Ghanaians. 'Apreprensa' had high contents of proteins (21.86 %), fat (20.07 %), fibre (6.04 %), and moisture (44%), Na (1.17 %), Ca (1.00 %) and K (3.40 %). 'Awiesu' had the highest content of carbohydrates (33.69%). 'Ntunkum' also had highest moisture (89.97 %), Ca (1.33 %) and high K (3.31 %).

Conclusions: Findings from this study may provide a basis for developing strategies to promote consumption of traditional foods in Ghana.

Key words: traditional foods, nutrition knowledge, consumers' behaviour, consumers' attitude, consumers' knowledge.

PO3011

HOME-GROWN CLIMATIC VARIABILITY ADAPTATION STRATEGIES IN MUBENDE DISTRICT

S J. Dembe[1], C. Namujju[2], E. Mbabazi[3], S. Musitwa[1], D. Nakayiza[4], E. Nambi[1]

[1]Global Initiative Uganda (GIU)
[2]Makerere University, Kampala-Uganda
[3]Crusade for Environmental Awareness Agency (CEAA .), Masaka, Uganda
[4]Research International Consult Uganda (RICU), Uganda

Farmers in Mubende compile information to predict annual variability in the timing and amount of rain, since they rely on rain-fed agriculture for food supplies and income. These farmers premise their prediction on: Longstanding familiarity with the seasonal patterns of precipitation and temperature; A set of local traditional climatic variability indicators; Observation of meteorological events and information about the progress of the seasons elsewhere in the region. These variables are examined and reflect the synergies amidst them. The social contexts in which this information is perceived is discussed, evaluated and applied. The cultural frameworks that support the use of this information are explored. This system of home-grown strategies leads farmers to act as agents as well as consumers in programs that use modern climate science to plan for and adapt to climate variability and climate change.

Key words: home-grown, climatic variability, climatic adaptation.

PO3012

FOOD ACQUISITION FORMS – BRAZIL, 2002-2009

L. Mondini[1], S F. Ramos[1]

[1]Institute of Agricultural Economics, Department of Agriculture of São Paulo , Brazil

Background and objectives: In Brazil, rising incomes, including the rural population, expanded the purchasing power of the population. Considering the interdependence of the agricultural sectors and those related to access to food, analy-

zed the changes in the forms of food acquisition of Brazilian families in the last decade.

Methods: Descriptive study with data from the 2002-2003 and 2008-2009 Household Budget Survey on food and beverage acquisition for household consumption, conducted by the Brazilian Institute of Geography and Statistics (IBGE). The form of household food acquisition per capita annual monetary or non-monetary (produced, fished, hunted, collected or received in Exchange, donation, among others) was obtained by the IBGE Automatic Recovery System (SIDRA) according to the sector location (urban or rural area, region).

Results: In 2002, the non-monetary form of products whose acquisition corresponded to at least 10% of the total quantity acquired were: coconuts and chestnuts (44.7%); fish, eggs, milk (ranged from 23% to 29.6%) and cereals, legumes, vegetables, fruits, flours and starches, pasta, poultry, pork meat and other meat (other than beef) (ranged from 10.4% to 19.3%). In 2008, this food group was reduced to fish, legumes, eggs, milk, other meats, coconuts/chestnuts. The reduction of the contribution of the non-monetary to total foods acquired occurred more intensely in the category 'own production' and, especially, in the rural area. Exception to the vegetables, pork meat and other meat, eggs and milk, whose percentage reduction were higher in urban area.

Conclusions: The increase in monetary form of food acquisition may represent positive characteristics of the Brazilian diet, however aspects related to food and nutritional security in terms of supply and access to food should be considered, especially with the increasing levels of urbanization in the country.

Key words: food acquisition, food securiry, nutritional security, urban, rural.

PO3013

ANALYSIS OF THE ASSOCIATION BETWEEN VISUAL FATIGUE AND DIETARY PATTERNS AMONG STUDENTS OF UNIVERSITIES IN XI'AN, CHINA

L. Ma[1], M X. Wang[1], R R. Liu[1], Q. Shi[2], X H. Liu[2]

[1]School of Public Health, Xi'an Jiaotong University College of medicine, Xi'an, Shaanxi, 710061, China
[2]The First Affiliated Hospital, Xi'an Jiaotong University College of medicine, Xi'an, Shaanxi, 710061, China

Background and objectives: To explore the association between dietary patterns and visual fatigue among students of universities in Xi'an, China.

Methods: According to the inclusion and exclusion criterions, 1 500 undergraduate and postgraduate from four universities were included in this study. The dietary intakes, life styles and symptoms of visual fatigue were accessed through questionnaires. The factor analysis and regression analysis were applied to assess associations between dietary patterns and visual fatigue.

Results: Four dietary patterns were found in the factor analysis, including "western" pattern, "plant" pattern, "high cholesterol" pattern and "prudent" pattern. "Plant" pattern (OR=0.89, 95 % CI : 0.80, 0.99) were associated with decreased risk of visual fatigue, while "high cholesterol" pattern were shown to be positively associated with visual fatigue (OR=1.12, 95 % CI: 1.01, 24). No associations were found between hypertension and other two dietary patterns.

Conclusion: Increased the dietary intakes of plant and decreased the intake of cholesterol was consistent with the decreased risk of visual fatigue for students of universities.

Key words: visual fatigue, dietary pattern, factor analysis

PO3014

INCREASING FOOD SECURITY THROUGH NATURAL RESILIENCE AND COPING STRATEGIES IN RURAL COMMUNITIES

R. Ddungu[1], H. Kasirivu[2], J. Ddembe[3], W. kyambadde[1], J. Kamahanga[4]

[1]Green World Uganda (GWU), Uganda
[2]Rural-Urban Health Initiative (RUHI), Kenya
[3]Research Community Development Health Initiative (RCDHI)
[4]Makerere University, Kampala-Uganda

Background and objectives: The study explores the viability of increasing food security through natural resilience and coping strategies in rural communities.

Methods: Data was collected using semi-structured questionnaires, personal interviews and focus group discussions.

Results: Finding indicated that communities depend on the use of natural resilience and coping strategies in sustaining small hold farming which for the core source of food. Small hold farmers use adaptive available materials to survive their crops through the hash environments. They employ small scale simple technologies to control pests and diseases, sustain post harvest handling and storage systems that make them food secure. They have viable local preservation methods that they use to preserve food for future consumption and seed for next season.

Conclusions: A strong conventional extension service is needed complimented with community based lead farmers as trainers of trainers to enhance action learning to improve productivity and production.

Key words: food security, natural resilience, coping strategies, rural communities.

PO3015

PHYSICAL FITNESS AND ACADEMIC PERFORMANCE AMONG UNIVERSITY STUDENTS IN SELANGOR, MALAYSIA

E. Maghsoudi[1], M. Kandiah[1], L. Wai Kong[2], M. Appukutty[3], B. Mohd Yusof[4]

[1]Department of Nutrition and Dietetics, Faculty of Medicine and Health Sciences, Universiti Putra Malaysia, Kuala Lumpur, Malaysia
[2]Department of Health, Faculty of Medicine and Health Sciences, Universiti Putra Malaysia, Kuala Lumpur, Malaysia
[3]Faculty of Sports Sciences and Recreation, Universiti Tecknologi Mara, Selangore, Malaysia
[4]Department of Nutrition and Dietetics, Faculty of Medicine and Health Sciences, Universiti Putra Malaysia, Kuala Lumpur, Malaysia

Background and objectives: Academic performance is the outcome of education. University students' achievement problems are often highlighted in academic literature and the mass media and therefore it is pertinent for educators to be aware and to study the factors related to student achievements such as health and physical fitness. This study explored the associations between health-related components of physical fitness which are consisted of morphologic fitness (body fat, BMI and waist circumference) and metabolic fitness (blood glucose, lipid profiles and hemoglobin) with academic performance.

Methods: This cross-sectional survey was conducted among 324 under graduate students whom (51.4%) were females from University Technology Mara (UiTM) Selangor, Malaysia, during 2010-2012 which were selected by systematic random sampling. The survey measured students' morphologic fitness by anthropometric measurements. A finger prick sample of blood was drawn by a trained laboratory technician to measure metabolic fitness. Students' registration numbers linked the responses of both questionnaires together, and subsequently linked the questionnaires to the university database to import the Cumulative Grade Point Average (CGPA) that students achieved.

Results: A Pearson's product-moment correlation showed that there was a weak, negative significant relationship between waist circumference and current CGPA (r=-0.120, p=0.034). Hence, there was a negative medium significant relationship between LDL-cholesterol and academic performance (r=-0.505, p=0.017). Running of Linear regression analysis (enter method) showed that entry level CGPA, household income and waist circumference contributed significantly towards academic performance (F=7.29, p<0.05).

Conclusions: It was concluded that the findings support a conceptual framework suggesting reciprocal relationships between physical fitness as a health component of physical fitness and academic achievement. Comprehensive health promotion programs may have the potential to influence relevant predictors of academic achievement in university students.

Key words: physical fitness, academic performance, university students.

PO3016

EXPLORING ENVIRONMENTAL, HEALTH AND NUTRITION IMPLICATIONS OF MEDITERRANEAN DIETARY PATTERNS

Y. Aboussaleh[1], R. Capone[2], H. El bilali[2], P H. Debs[2], G. Cardone[2]

[1]Nutrition and Healrh Laboratory,Ibn Tofail University, Morocco
[2]Sustainable Agriculture Department .Mediterranean Agronomic Institute of Bari, Italy

Background and objectives: Improving nutrition is of paramount importance for effectively preventing and combating non-communicable diseases (NCDs) and achieving environmental sustainability. Dietary patterns are a significant factor in a number of critical sustainability issues such as climate change; public health; social justice; biodiversity; energy, land and water use; and food and nutrition security. This paper aims at providing an overview of the main implications of the Mediterranean food consumption patterns on nutrition, health and natural resources (water, land and biodiversity).

Methods: The work is based on an extended review of secondary data. FAO food balance sheets and standard footprint data were used to characterize the Mediterranean dietary patterns (MDPs) and to discuss water, carbon and ecological footprints of food consumption.

Results: The share of animal-based energy in the MDPs is lower than in North European and American ones. MDPs promote the use of a wide range of cereals, fruit and vegetables. About 2,300 plant species are consumed in the Mediterranean. Moreover, the use of less animal-source foods reduces the impacts of the livestock sector on biodiversity and natural resources. Adherence to the traditional MDP allows meeting better nutrient and micronutrients requirements for a healthy and active life. There is strong evidence on the beneficial effect of the MDP on death risk from obesity, type 2 diabetes, cardiovascular diseases and some cancers. The per capita ecological footprint, water footprint and carbon footprint in the Mediterranean, especially in Southern and Eastern Mediterranean countries, are lower than those recorded in North Europe and North America. Nevertheless, food consumption represents the highest share of water footprint of consumption in the Mediterranean.

Conclusions: Promotion of more sustainable diets in the Mediterranean - through increased adherence to the traditio-

nal MDP - can contribute to NCDs prevention and sustainable natural resources management.

PO3017

DIETARY ITEMS DEFINING A NORDIC DIET – AN A PRIORI INVESTIGATION IN THE EPIC COHORT

N . Roswall[1], A. Olsen[1], K. Boll[1], J. Christensen[1], J. Halkjær[1], K. Overvad[2,3], T. Sørensen[4], A. Tjønneland[1]

[1]Danish Cancer Society Research Center, Copenhagen, Denmark
[2]Department of Epidemiology, School of Public Health, Aarhus University, Aarhus, Denmark
[3]Department of Cardiology, Aalborg Hospital, Aarhus University Hospital, Aalborg, Denmark
[4]Institute of Preventive Medicine, Copenhagen University Hospital, Copehagen, Denmark

Background and objectives: A recent study found decreasing mortality with increasing adherence to a Nordic dietary index. This suggests a preventive potential in promoting health-enhancing aspects of the Nordic diet. However, it has not been examined whether these components are exclusively related to the Nordic countries, or if they are inherent in other European diets as well, suggesting a broader preventive potential. This study's objective was to describe the intake of seven a priori defined health-beneficial food components of a Nordic diet-culture (apples/pears, berries, cabbages, dark bread, shellfish, fish, and root vegetables) across 10 countries participating in the European Prospective Investigation Into Nutrition and Cancer (EPIC).

Methods: A 24-hour diet recall was administered to 36,970 men and women, aged 35-74 years, constituting a random sample of approximately 520,000 EPIC-participants. Information on intake of the included components was collected through a standardized software programme across countries, containing country-specific foods and recipes. Crude, sex-specific mean food intake and share of overall food groups (vegetables, fruits, bread, meats) consumed as healthy Nordic food items were calculated for each centre/country. All analyses were weighted by day and season of questionnaire collection.

Results: Cabbages and berries showed the highest intake in Central European countries, apples/pears showed the highest intake in the Southern European countries, dark bread showed the highest intake in Norway, Denmark and Greece, fish showed the highest intake in Southern as well as Northern countries, shellfish showed the highest intake in Spain and root vegetables in Northern and Central European countries. However, there was large centre-variation within countries.

Conclusions: Some healthy dietary components are strongly related to a Nordic dietary tradition; especially dark (rye) bread, root vegetables and fish. Apples/pears and shellfish on the contrary shows the highest consumption in Southern Europe.

Key words: Nordic diet, Europe, food habits, health promotion.

PO3018

GREEK DIET: NUTRITIONAL COMPOSITION OF 24 CRETAN EDIBLE WILD PLANTS

S. Zeghichi-Hamri[1], S. Kallithraka[2], A. Simopoulos[3]

[1]Department of food sciences, Bejaia University, Bejaia, Algeria
[2]Wine Institute of Athens/NAGREF, Athens, Greece
[3]The Center for Genetics, Nutrition and Health, Washington, USA

Background and objectives: Wild plants are rich sources of antioxidants and omega-3 fatty acids. Recent evidence has confirmed the importance of plant foods. It is therefore, important to investigate the nutritional composition of diets such as the Cretan diet which has been shown to be associated with a decreased rate of cardiovascular disease and cancer.

Methods: This study was carried out at the Mediterranean Agronomic institute of Chania (Crete) to analyze the nutritional composition of tender leaves of 24 wild leafy plants widely eaten in Crete. Their contents of alpha-tocopherol, total phenols, nitrates and minerals (K, Na, Ca, Mg, Fe, Cu, Mn, Zn, and P) as well as their antioxidant activity were determined using advanced analytical methods.

Results: The results showed that all the plants contained considerable amounts of antioxidants and mineral elements. Tordylium apulum contained the higher amount of a-tocopherol, 2.426 mg/100g wet weight. Rumex ssp. contained the highest amount of total phenols, 102.56±3.13 mg/100g wet weight followed by Cichorium pumilum 93.643±0.28 mg/100g. Whereas Oenothera pimpineloides was more efficient antioxidant than the rest of the plants (EC50=0.222±0.018). All analyzed wild plants contained small amounts of nitrates (8±0.002-203±0.016 mg/100g wet weight), whereas, they contained considerable amounts of minerals. Tragopogon sinuatus and Scandix pecten-veneris had the highest quantity of calcium comparing to the rest of the plants, 3120±1.2 and 2790±1.43 mg/100g dry weight respectively. Ranunculus ficarioides presented the maximum quantity of zinc, 7.01±0.82 mg/100g dry weight, while Rumex ssp. has shown the maximum level of phosphorus equal to 804±1.11 mg/100g dry weight.

Conclusions: The Cretan diet being rich in edible wild plants may be a reference standard for modern human nutrition and a model for defense against certain disease of affluenc.

Key words: wild plants, Cretan diet, polyphenols, antioxidant activity, mineral elements.

PO3019

THE MEDITERRANEAN DIET OF THE MAGHREB AND CANCER

S. Zeghichi-Hamri[1], S. Kallithraka[2], M. Zeghichi[1]

[1]Department of food sciences, Bejaia University, Bejaia, Algeria

[2]Wine Institute of Athens/NAGREF, Athens, Greece

Background and objectives: The term 'Mediterranean diet' is very loose since geographical, political and religious limits prevent a uniform dietary pattern across the Mediterranean countries and directly influence the dietary customs and habits. Thus, defining the Mediterranean diet at a regional level may provide more information than describing a common Mediterranean food pattern. Under these constraints, we will discuss the Mediterranean diet in the Maghreb (Algeria, Libya, Morocco and Tunisia).

Methods: The composition of the diets of the Maghreb was determined in terms of absolute quantities per consumption unit per year. The source of the presented food consumption data are mostly generated nationally, but collected, analyzed and published in a standardized manner by the FAO.

Results: The Maghreb diet is characterized as being a diet particularly high in cereals since they provide more than 50% of the dietary energy and protein intake. This diet is also rich in fruits and vegetables and thus rich in vitamins, antioxidants and fiber. In addition, the diet of the Maghreb is low in total fats (they provide less than 30% of the total energy), low in saturated fats (less than 6% of the total energy) with low amounts of added fats, predominantly vegetable oils. Animal product consumption is also very low. High levels of proteins from animal products may not only injure the walls of the coronary arteries; which can start the buildup of cholesterol; they can also promote blood clots; which can be the ultimate cause of a heart attack.

Conclusions: Despite the overall changes regarding dietary patterns, the Maghreb diet could be protective against obesity, cancer and other chronic diseases.

Key words: Mediterranean diet, Maghreb, cereals, fruits, vegetables.

PO3020

FOOD PRACTICES CHANGES AND CARDIOVASCULAR DISEASE RISK FACTORS OF SAHRAOUI ETHNIC GROUP IN SOUTH OF MOROCCO

M. Rguibi[1], H. Barouaca[2], R. Belahsen[1,3]

[1]Biology Department, Training and Research Unit on Nutrition & Food Sciences, Laboratory of Biotechnology, Biochemistry & Nutrition, Chouaib Doukkali University, School of Sciences, El Jadida, Morocco

[2]Moroccan Association of Health and Nutrition Education, Casablanca, Morocco

[3]Biology Department, Laboratory of Biochemistry Nutritional Biochemistry Unit, Faculty of Sciences Dhar El Mahraz, University of Sidi Mohamed Ben Abdellah, Fez, Morocco

Background and objectives: Food habit of all populations that knew a lifestyle modification, didn't escape of this change with both positive and negative health consequence. We assess lifestyle change and its related cardiovascular disease risk factors of Sahraoui population in south of Morocco.

Methods: Data were collected from two samples of regional surveys conducted in 2001 (n=249) and 2011 (n=201) and from a sample of older women (n=21) who had a nomadic lifestyle. The samples was randomly selected among adult healthy women aged 15 years and older, non pregnant.

Results: The traditional diet was based largely on dairy products and barley. Currently, several traditional foods are consumed either frequently such as soup, rice, couscous, camel meat or less frequently such as camel milk, dates and dishes from barley flour. The camel products are still appreciated whereas those of cow are not. The intake of sweet drinks is relatively high. Eating fat on meat and adding sugar to some dishes and to traditional drinks are also reported by the majority. In addition, eating from a common plate is still a very important part of this ethnic way of life and in contrast to nomadic lifestyle, urban population is implicated in many sedentary activities. Moreover, cardiovascular risks factors among sahraoui women were very prevalent and its have also increased during the last ten years. Also, between 2001-2011, there was a significant increase of percentage of women who want to lose body weight but the desire to gain weight remains very high. Obesity was negatively associated with time spent in walking and positively with some sedentary activities.

Conclusions: Changes in food consumption associated with obesity and sedentary may increase the risk for several chronic diseases, suggesting apparent needs for immediate attention in terms of prevention and health education.

Key words: food practices, Saharaoui, Morocco.

PO3021

INDIVIDUAL DIFFERENCES IN THE METABOLISM OF ISOFLAVONES AFTER SOY INGESTION IN 5 AGE-MATCHED YOUNG WOMEN

K. Hosoda[1], H. Hirano-Shibasaki[2], A. Yokokawa[2], T. Furuta[2], K. Ishii[1]

[1]Department of Clinical Pharmacology, School of Health Sciences, Kyorin University, Tokyo, Japan
[2]Department of Medicinal Chemistry and Clinical Pharmacy, School of Pharmacy, Tokyo University of Pharmacy and Life Sciences, Tokyo, Japan

Background and objectives: Much attention has been paid to the metabolism of isoflavones daidzein (Dein) and genistein (Gein) with regard to the prevention of several hormone-dependent diseases. It was recently reported that several glucuronic and/or sulfuric acid conjugated metabolites of Dein and Gein are also biologically active. The aim of this study was to investigate whether individual differences in the amount of biologically active metabolites in body after ingestion of kinako (baked soybean flour) to age- and sex-defined volunteers exist or not.

Methods: Ten grams of kinako was ingested to 5 healthy Japanese women aged 21 to 22 years. The quantifications of 16 isoflavone metabolites in plasma and urine obtained 0 to 48-h after ingestion of kinako were performed by LC-MS/MS.

Results: Total areas under the curves (AUC) (0-48 h) of Dein and Gein metabolites were 3.3-9.6 ƒÊmol/L and 10.1-26.0 ƒÊmol/L, respectively. Major metabolites of Dein and Gein in plasma were estrogenic active Dein-7-glucuronide-4'-sulfate and Gein-7-glucuronide-4'-sulfate, and inactive Gein-4',7-diglucuronide. The AUC values of these metabolites varied 2.8-3.6 fold among subjects. The amounts of Dein-7-sulfate to exhibit hypotensive effect widely varied among subjects (33.7 fold). The compositions of isoflavone metabolites in urine and plasma were greatly different. Approximately half of the 48-h urinary excretion of total Dein metabolites consisted of Dein-7-glucuronide. Gein-7-glucuronide was 40% of the total amount of the urinary Gein metabolites.

Conclusions: Biologically active conjugated metabolites of Dein and Gein in plasma and urine varied widely in young women of almost the same age. Individual differences in the amounts of the active metabolites of isoflavones in body fluids could be due to the dietary habits and genetic polymorphism of metabolic enzymes, leading to different biological effects (estrogenic effect, natural killer cell activation effect and hypotensive effect) after soy ingestion among individuals.

Key words: isoflavone, glucuronide, sulfate, sulfoglucuronide.

PO3022

ACCEPTABILITY OF COMPLEMENTARY FOODS WITH INDIGENOUS ANIMAL SOURCE FOODS AND CORN SOY BLEND PLUS AMONG YOUNG CHILDREN/MOTHERS IN KENYA

S. Konyole[1], J. Kinyuru[2], B. Owuor[3], N. Roos[4], H. Friis[4], J. Aagaard[5], B. Estambale[1], V. Owino[1]

[1]University of Nairobi Institute of Tropical and Infectious Diseases (UNITID),University of Nairobi,Nairobi,Kenya
[2]Department of Food Science and Technology, Jomo Kenyatta University of Agriculture and Technology,Juja,Kenya
[3]Department of Biology,Catholic University of Eastern Africa,Nairobi,Kenya
[4]Department of Human Nutrition,University of Copenhagen,Copenhagen,Denmark
[5]Steno Diabetes Centre,Copenhagen,Denmark

Background and objectives: We assessed acceptability of two flours and porridges of complementary foods based on germinated grain amaranth and maize with or without edible termites and dagaa small fish named "Winfood Classic" (WFC) and "Winfood Lite" (WFL), respectively, compared to Corn Soy Blend Plus (CSB+) among mothers and young children in a rural setting in Western Kenya.

Methods: In a cross over design, Fifty seven (57) healthy children consumed each of the three foods on separate days with one-day washout between foods. Each food was considered acceptable if the child consumed at least 75% of the serving. Mothers too ranked the flours and the prepared porridges based on a 5-point hedonic scale with 1-dislike extremely to 5-like extremely. Morbidity data (for the past one week) based on caretakers recall was also assessed.

Results: Most mothers preferred WFL flour and porridge (63.2% and 70.2%, respectively) compared to WFC (24.4% and 10.5%) and CSB+ (12.3% and 19.3%). Children consuming at least 75% of served porridge were 43%, 19.6% and 21% for WFL, WFC and CSB+, respectively. No adverse effects were observed for all the foods throughout the study period and follow up lasting 4 weeks.

Conclusions: All foods were acceptable and can further be developed and be tested for efficacy.

Key words: amaranth grain complementary food; Dagaa fish; edible termites; acceptability; CSB+.

PO3023

SOCIOECONOMIC AND ANTHROPOMETRIC PROFILE OF RICE-BASED FARM FILIPINO HOUSEHOLDS

R. Abilgos-Ramos[1], K. Avila-Cortado[1], C. Launio[2]

[1]Rice Chemistry and Food Science DIvision, Philippine Rice Research Institute, Philippines
[2]Socioeconomics Division, Philippine Rice Research Institute, Philippines

Background and objectives: Farming communities remain poor and nutritionally-vulnerable in many developing countries. In the Philippines, many of the rural poor families are rice farmers. This study determined policy-relevant socioeconomic factors associated with nutritional status of rice-based farm Filipino households.

Methods: Socioeconomic characteristics and anthropometric measurements were obtained from 389 respondents of rice-based farm households (with five members per household on the average) in six provinces of Central Luzon, Philippines.

Results: Many of the rice-based household heads completed 1st to 2nd year high school and have major occupation. More than half (58%) obtain their main income from agriculture with mean farm area of 1.74 hectares (ha) of which 1.66 ha is devoted to rice farming and the remaining 0.08 ha for vegetable and fruit production. Majority (90%) of the sample respondents farm less than three ha of agricultural area and only 10% with greater than three ha. Annual income of many sampled households (81%) is at least PhP 18,981 (US$474). Based on the results of anthropometric measurements and World Health Organization standard (WHO, 1995), there is a high prevalence of acute and chronic undernutrition among children aged 0-10 years old. In terms of weight for age, height for age and weight for height, 21.9% of the children were underweight to severely underweight, 20.7% were stunted, and 17.8% were wasted, respectively. Interestingly, a considerable number of children were tall (15.8%) in terms of height for age and 8.9% were over their ideal weight for age.

Conclusions: Results from this study showed that agriculture and rice farming remain as the main source of income for rice-based farm Filipino households in rural areas. High prevalence of malnutrition remains to be a public health concern among our rice farmers and their family members.

Key words: anthropometric measurement, socioeconomic characteristics, rice-based farm households.

PO3024

BREASTFEEDING PRACTICE OF ETHNIC GROUPS IN RURAL WESTERN CHINA

P. Qu[1], H. Yan[1], L. Zeng[1], X. Zhou[1]

[1]Department of Epidemiology and Biostatistics, School of Public Health, Xi'an Jiaotong University College of Medicine

Background and objectives: Breastfeeding is an important factor for infant health, and there have been few previous studies on breastfeeding practice in the different ethnic groups in western China. We aimed to compare breastfeeding rates among four main ethnic groups (Han, Uygur, Tibet and Zhuang) living in rural western China.

Methods: The study was a cross-sectional survey conducted in 2005 in ten provinces of western China. A sample of 11783 children (8960 Han, 1281 Uygur, 792 Tibet, 750 Zhuang) less than 36 months old and their mothers were recruited by stratified multistage cluster random sampling method. Mothers were interviewed to collect information on feeding practice by a designed family questionnaire including initial time and duration of breastfeeding, etc.

Results: Exclusive breastfeeding rates under six months in four ethnic groups (Han, Uygur, Tibet and Zhuang) were 11.6%, 0.8%, 4.4% and 13.8% respectively. The continued breastfeeding rates at 2 years were 8.5%, 25.7%, 3% and 4.3% in four ethnic groups respectively. Uygur babies were least likely to be exclusive breastfed while Zhuang babies were most likely to be exclusive breastfed. Uygur babies were most likely to have a longer duration of breastfeeding than other ethnic groups.

Conclusions: Exclusive breastfeeding rates under six months and continued breastfeeding rates at 2 years were different in Han, Uygur, Tibet and Zhuang ethnic groups and they were far below that WHO recommended. Health education on feeding practice is needed in rural western China.

Key words: breastfeeding, ethnic groups, western China.

PO3025

NUTRITION TRANSITION, ADVERTISING AND MEDICALIZATION OF FOOD IN BRAZIL

S. Prado[1], G. Freire[1], M. Macedo[2]

[1]Núcleo de Estudos Sobre Cultura e Alimentação (NECTAR), Instituto de Nutrição, Universidade do Estado do Rio de Janeiro, Rio de Janeiro, Estado do Rio de Janeiro, Brasil

[2]Faculdade de Comunicação Social, Universidade do Estado do Rio de Janeiro, Rio de Janeiro, Estado do Rio de Janeiro, Brasil

Background and objectives: The nutrition transition process in Brazil has been predominantly analyzed from theoretical frameworks in the field of Biomedicine. According to Lipovetsky, this nutrition phenomenon marks the hypermodern world of consumption, requiring other approaches from the Human Sciences. Food advertising has been considered more than just a sales agent, but a mechanism establishing influences and reconstruction of identities and consumption practices, including dietary patterns. We seek to reflect critically on the advertising discourses encountered on magazines designed to women. Such media advertises weight losses of 20 to 50 kg in a few months or weeks by means of shakes, drugs, and diets allegedly natural. Easy weigh losses are advertised in the form of inexpensive products that do not offer risks to health.

Methods: Based on Foucault, we submitted to the analysis of discourse the popular magazines "Sou Mais Eu!" and "VIVA! Mais", published in 2011, which are among the top magazines marketed in Brazil.

Results: In line with Conrad, we consider that this advertising model is part of a food medicalization process consisting of consumption patterns or codes that lead to an ideal body, strongly eroticized and from which individual problems will be solved. We also argue that according to Hall, Giddens, and Marx, the consumer society requires us to be saleable and that the arrangement comprising women's magazines covers, food and medicalization is also underlined by a reification process that tranforms people into merchandise.

Conclusions: The magazines that were analyzed operate in processes of construction of individual and collective identities in the contemporary society. Addressed as mere consumers and objects of consumption, women are socially emptied of their potential ability to take care of their own nutrition and health. Such phenomenon is part of a scenario of increasing levels of obesity in the Brazilian nutrition transition.

Key words: g. women's magazines, medicalization.

PO3026

CONSUMPTION OF CASSAVA LEAVES AND KNOWLEDGE OF THEIR NUTRITIONAL VALUE AMONG GHANAIAN FARMERS FROM THREE GEOGRAPHICAL BELTS

W. Opoku-Nkoo[1], E. Asibey-Berko[1], A. Lartey[1]

[1]Department of Nutrition and Food Science, University of Ghana, Accra, Ghana

Background and objectives: A problem with cassava leaves consumption is the presence of cyanogenic glycosides which release cyanide. Consumption of a cyanogenic plant is linked to iodine deficiency. However, with adequate processing, the cyanide can be reduced to safe residual levels. The study aimed at investigating the consumption and knowledge about the nutritional value of cassava leaves among Ghanaian farmers.

Methods: Nine communities, three each from southern, middle and northern Ghana were selected. The study was conducted on 100 cassava farmers from the selected communities. A pretested semi-structured questionnaire was used to collect data on cassava leaves consumption, farmers' knowledge about their nutritional value and methods for processing cassava leaves for consumption. Chi-square was used to find any significant differences in the responses from farmers among the three geographical locations.

Results: Consumption and reservations about consuming cassava leaves were significantly associated with geographical location of the respondent (p=0.001). Approximately 81.8% of those in northern Ghana consumed cassava leaves compared to 39.0% and 31.4% in middle and southern Ghana respectively. There were differences in the way cassava leaves were processed for consumption, by geographic location. In northern Ghana cassava leaves were always processed by pounding followed by boiling, while in middle and southern Ghana, the leaves were sometimes chopped followed by boiling; or just boiling without any pre-treatment. Respondents with no knowledge of the nutritional value of cassava leaves were located more in the middle (23.0%) and southern (22.7%) parts of the country, compared to 16.5% in the northern part.

Conclusions: Farmers in northern Ghana widely consume cassava leaves. They are familiar with their nutritional value and use adequate processing techniques (pounding followed by boiling) for preparing cassava leaves for consumption, compared to farmers in middle and southern Ghana.

Key words: cassava leaves, consumption, Ghana.

PO3027

ASSESSMENT OF MILK CONSUMPTION IN YOUNG ADULTS

P. Asho[1], B. Balsubramanian[1], A. Joshi[1]

[1]Bharati Vidyapeeth Deemed University Medical College Pune

Background and objectives: Milk and dairy products are nutritious food items containing numerous essential nutrients, but in the last few decades, soft drink consumption has steadily increased while milk intake has decreased. Excess consumption of soft drinks and low milk intake may pose risks of several diseases such as dental caries, obesity, and osteoporosis. Identification of the independent effects of milk and or calcium intake during specific periods of life is important for efficient targeting of interventions to maximize their long-term benefit. So the present study is planned to assess the consumption of milk in these young adults.

Methods: Dietary milk intakes was taken by using food-frequency interview of 100 medical MBBS students which includes 64 female and 36 males aged between 18-25 yrs with recall of previous milk intake of last 3 month. This milk intake was taken if it is daily , weekly or monthly basis. The percentage and frequency was noted and data was analysed by using chi square tests.

Results: We found that 75% males and 68% females was taking milk of different type like milk. 51% females and 52% males consuming daily milk. 25% males and 32% female not consuming any type of milk. Remaining were consuming milk on weekly or monthly .There is no significant difference for consumption of milk between male and females ($p > 0.05$).

Conclusions: Areas that need immediate attention and future research imperatives like other dairy product consumption. Health benefits of milk should be emphasized to the student for their long term health in adulthood. And follow up with intermittent food questionnaire administration for improvement of milk consumption.

Key words: milk consumption, long term health benefits, young adults.

PO3028

DIETARY PATTERNS OF PAKISTANI ADULTS AND THEIR ASSOCIATIONS WITH SOCIODEMOGRAPHIC, ANTHROPOMETRIC AND LIFESTYLE FACTORS

N. Safdar[1], E. Bertone-Johnson[2], L. Cordeiro[3], T. Jafar[4], N. Cohen[3]

[1]School of Public Health, Dow University of Health Sciences, Karachi, Pakistan
[2]Department of Public Health, School of Public Health and Health Sciences, University of Massachusetts, Amherst MA, USA
[3]Department of Nutrition, School of Public Health and Health Sciences, University of Massachusetts, Amherst MA, USA
[4]Department of Community Health Sciences, Aga Khan University, Stadium Road, Karachi, Pakistan

Background and objectives: Dietary pattern analysis is a technique to characterize the complexity of food among populations into meaningful representation. Our aim was to identify dietary patterns among low income urban Pakistani adults and examine their relationship with sociodemographic, anthropometric, and lifestyle factors.

Methods: Principal component factor analysis was used to identify dietary patterns in 5491 adults from the Control of Blood Pressure and Risk Attenuation (COBRA) study. Relationship between these patterns and sociodemographic, anthropometric, and lifestyle factors were assessed by analysis of variance, Chi-square, and general linear model statistics.

Results: Three major dietary patterns, fat and sweet, fruit and vegetable, and seafood and yogurt patterns, were identified with 20% variance in dietary intake. The fat and sweet pattern was characterized by food purchased from outside the home including Pakistani bread, fried snacks/foods desserts, organ meats, and bakery products. The intake of this pattern decreased among participants who were male, older and with high BMI, waist circumference, and waist-to-hip ratio. Fat and sweet pattern scores were higher in those who were single and physically more active. The fruit and vegetable pattern included fruits, juices, raw and cooked vegetables, lean meat, and low fat milk and their scores increased for non-tobacco users and educational attainment. The seafood and yogurt pattern, characterized by prawn, fish, potato, and yogurt, was associated with increased age and physical activity, and decreased waist circumference and waist-to-hip ratio.

Conclusions: Low income Pakistani urban adults have unique and culturally relevant dietary patterns that are associated with gender, age, education and some of the anthropometric and lifestyle variables. Given the nutrition transition and associated diet-related diseases in Pakistan, our results have important public health implications in developing culturally

relevant dietary and lifestyle guidelines to promote improved health and prevent diseases.

Key words: dietary patterns, factor analysis, Pakistan, lifestyle behaviors.

PO3029

TASTE PREFERENCES AND NUTRITIONAL INTAKE IN RELATION TO OBESITY PREVENTION IN THE XINJIANG DISTRICT OF CHINA

S. Muto[1], J. Fujikura[1], H. Nakayama[2], A. Dawut[3]

[1]Nutrition,Kagawa Nutrition University, Sakado, Saitam, Japan

[2]Information and Arts,Tokyo Denki University, Hatoyama, Saitama, Japan

[3]Education, Xinjiang University, Urumqi, Xinjiang Uygur, China

Background and objectives: In the Xinjiang Uygur Autonomous Region in northwestern China, remarkable increases in urbanization and motorization have led to the emergence of a number of lifestyle-related diseases, including obesity. This study aims to determine the roles that taste preferences and nutritional intake play in relation to obesity, and to develop strategies based on these findings that will promote improvements in eating habits and obesity prevention.

Methods: Typical foods were collected from the cities of Urumqi and Turpan in August, 2012. They were then analyzed using a taste sensor. Both the initial taste (the taste experienced immediately after food enters the mouth) and aftertaste (the taste which remains after the food has been swallowed) of the five basic tastes (umami, bitter, salty, sour, sweet), as well as astringency, were evaluated and assigned numerical scores. In addition, nutrition intake were calculated after food composition analysis.

Results: The traditional noodles of the region have a relatively plain and natural taste compared to Japanese noodles. Their sodium and sugar contents (0.8% and 5%, respectively) also differed from those in Japanese noodles (1.1% and 6.5%, respectively). Uygur grapes had higher sugar content and were less sour than Japanese grapes. Daily food and energy intake measurements were 2270 grams and 4800 calories, respectively, with an energy ratio of 53:35:12 for carbohydrate, fat, and protein, respectively. Average daily energy intake at breakfast, lunch, dinner and between-meals was calculated as 16%, 34%, 38% and 12%, respectively.

Conclusions: Based on these results, the following points should be considered important for obesity prevention: (1) reducing the quantity of food consumed; (2) reducing eating speed; (3) changing order to eat; (4) reducing fat intake; (5) consuming more vegetables; and (6) adding some seasonings attracting attention to taste.

Key words: Uygur, food taste, taste sensor, nutritional intake, obesity prevention.

PO3030

KNOWLEDGE AND ATTITUDES OF DIETITIANS CONCERNING SEAFOOD CONSUMPTION AND COMMON PROCESSING/ PRESERVATION TECHNOLOGIES

S. Mol[1], B. Eygi Erdogan[2], D. Ucok Alakavuk[1]

[1]Istanbul University, Fisheries Faculty, Department of Seafood Processing and Quality Control, Istanbul, Turkey

[2]Marmara University, Arts and Sciences Faculty, Department of Statistics, 34722, Goztepe, Istanbul, Turkey

Background and objectives: This survey was carried out to measure well-educated (bachelor-degree) consumers' attitudes and knowledge regarding seafood consumption and common processing and preservation technologies. The goal was to compare knowledge level of the respondents, educated in nutrition science, to the other bachelor-degree respondents. Eighty-five of the respondents were educated in nutrition science (dietitians) and 221 in other sciences (non-dietitians).

Methods: First of all the data was organized and visualized for each variable. Then descriptive statistics and frequencies were computed. Finally to see the relationship among the variables Chi-square independance tests were made. NCSS statistical software was used for the analysis.

Results: It was seen that opinions of the respondents were generally dependent of being a dietitian ($p<0.05$). Dietitians were generally against or not recommending the consumption of mussels, crustaceans, lakerda, salted and smoked seafood and kitosan, while non- dietitians more prone to their consumption. On the other hand, dietitians had a positive approach to the technological products such as canned and frozen seafood, fish oil, surimi, sous vide and MAP packed seafood, spirulina, and aquaculture fish, while they were not supported by the non- dietitians.

Conclusions: It was seen that, most of the processed seafood products are not known by the respondents. Receiving high percentages of the answer "I do not know what it is" from the dietitians was also remarkable, indicating their lack of knowledge. These results validate the importance of education on various seafood products and common processing /preservation technologies to create more informed dietitians.

Key words: dietitian, seafood, attitudes, fish, survey.

PO3031

TACKLING MALNUTRITION BY IMPROVING ECONOMICAL SKILLS AND NUTRITIONAL AWARENESS OF "PORRIDGE MUMS": RESULTS AND LESSONS LEARNT FROM GUINEA-CONAKRY

J. Jacob[1], M. Sanchez[1], C. Costis[1]

[1]Accion Contra El Hambre (ACF Spain)

Background and objectives: In response to worrying malnutrition rates (20,8% underweight), ACF-Spain and its partners supported women (aka 'porridge mums') producing and selling locally-made nutritious foods (mostly based on rice, corn, millet) in urban communities of Guinea-Conakry. Main objectives were to increase incomes and enhance porridge mums' role in the prevention of malnutrition through community-based activities.

Methods: This 18-month program targeted 300 women within two of the most food insecure districts of the capital city. Activities included trainings on nutrition education, technical and entrepreneurial skills, processing and preservation of local products. Regular monitoring was conducted to measure the effects of activities on beneficiaries and achievement of project objectives.

Results: The socio-economic impact on families of beneficiaries is positive. An increase in number of clients and income (44%) was noticed for most women, based on acquired knowledge and equipment provided by the project. Extra income was largely spent to meet basic needs of families, with women contributing 56% of household income. Balance of macronutrients within the porridge recipe has improved ; introduction of food safety measures were clearly observed for 91% of women. However, the nutritional effects have been limited to the family circle of beneficiaries (improved diet for 87% of them) and have not extended to their clients, mostly due to their reluctance to increase the selling price of an enriched porridge.

Conclusions: The project evaluation suggested that food-based income generating activities could be a good strategy to prevent malnutrition for categories of mothers with children more inclined to suffer malnutrition. Links should be reinforced between porridge mums and producers of affordable nutritional supplement of micronutrients such as Moringa oleifera. Finally, including local health structures and targeting Community Health Workers could complement a sustainable model of funding nutritional screening and sensitization activities.

Key words: nutrition, education, income, porridge, Conakry.

PO3032

TRADITIONAL SOLUTIONS FOR HIGH LEVELS OF CHILDHOOD ANAEMIA IN THE PERUVIAN ANDES

B. Gillespie[1], L. Rivera[1], A. Gómez[2]

[1]Technical Department, Action Against Hunger Spain, Lima, Peru

[2]Technical Department, Action Against Hunger Spain, Madrid, Spain

Background and objectives: Recent surveys show that up to 75% of children under three suffer from anaemia in the rural Peruvian Andes. The research area, Huanta, Ayacucho, is largely Quechua-speaking, and some villages are several hours walk from market and health services. 46% of Quechua speaking children live in extreme poverty, compared with 12% of Spanish speaking children. Government multi-micronutrients have low take up rates due to cultural factors. This study aimed to identify traditional practices with implications for the availability of iron in the diet.

Methods: 16 families with children under three years of age in four locations of varying altitude and market access participated in a one-year anthropological study.

Results: This study unearthed the almost-forgotten tradition of blood "charqui" - boiling and drying of animal blood for later consumption. Although blood charqui is no longer practiced, preparing blood-based dishes (fried blood, blood sausage) is culturally acceptable, and drinking blood is recognized by the elderly as a cure for weakness. However, in the last generation blood has begun to be treated as waste and fed to dogs. Although rural families believe that home-grown food is best for health, urban practices are replacing local food culture, a process linked to cultural discrimination faced by rural indigenous people, often expressed through authority figures such as health professionals.

Conclusions: Blood charqui is a low-cost, iron-rich food and is does not require complicated techniques, especially for families accustomed to drying meat (a tradition still common in the Andes). Blood charqui can be stored and cooked especially for toddlers (while dried meat is quickly consumed by family members as a snack). As well as helping to reduce anaemia, including blood charqui in Health Services programs can help breach the cultural gap between State services and rural users.

Key words: anaemia, blood drying, Andes, culture.

PO3033

MIGRATION AND GENDER ROLES IN RELATION TO HIGH LEVELS OF CHILDHOOD ANAEMIA IN THE PERUVIAN ANDES

B. Gillespie[1], L. Rivera[1], A. Gómez[2]

[1]Technical Department, Action Against Hunger Spain, Lima, Peru
[2]Technical Department, Action Against Hunger Spain, Madrid, Spain

Background and objectives: Surveys show that 75% of children under three suffer from anaemia in the rural Peruvian Andes. Government multi-micronutrients have low take up rates due to cultural factors. This study aimed to identify social relations and traditional practices with implications for the availability of iron in the diet.

Methods: A one-year anthropological study and hemoglobin tests were carried out with mothers and fathers of 16 children under three (one child per family) in four locations of varying altitude and market access.

Results: It was found that children with fathers who are absent (economic migration several months a year) or uninvolved were more likely to suffer from anaemia. Of 16 families, 5 fathers migrate, 2 are single mothers and 2 fathers are present but uninvolved in childcare. The 5 children whose fathers migrate all have anaemia, compared to 3 of the 9 children (33%) of non-migrants. Migration of fathers leads to higher workload for women and less decision-making capacity (mother in law controls work, meals and shopping). Mothers perceive children to be healthier when the father is home. If children of single mothers and uninvolved fathers are included along with those of migrants (for a total of 9 children), it was found that 7 of 9 (78%) are anaemic. In contrast, of the remaining 7 children (those with present and involved fathers), 4 suffered from anemia in the first hemoglobin test and 2 (22%) in the second (two recovered in the course of the study, perhaps as a result of learning of the threat of anaemia).

Conclusions: Women's agricultural workload makes it difficult to meet feeding needs of children. Children of migrating fathers appear to be a special risk group. Present and involved fathers enable mothers to react to children's' health problems.

Key words: anaemia, women´s role, migration, Andes.

PO3034

CULTURAL FACTORS RELEVANT FOR THE FIGHT AGAINST CHILD MALNUTRITION IN THE PERUVIAN ANDES

B. Gillespie[1], P. del Pino[2]

[1]Technical Department, Action Against Hunger Spain, Lima, Peru
[2]Research , Instituto de Estudios Peruanos, Lima, Peru

Background and objectives: Chronic child malnutrition is 40% in rural Ayacucho in the Peruvian Andes. In order to contribute to government health programs to reduce child malnutrition, a study was carried out to examine underlying cultural factors of the Quechua-speaking rural population relevant for fight against malnutrition.

Methods: A team of five researchers carried out anthropological research in 4 villages in rural Ayacucho for 2 weeks a month for 6 months and regularly visited nearby Health Centres. Techniques included participant observation, interviews, discussion groups and surveys.

Results: Infant care practices that have been described as negligent are in fact related to detailed traditional knowledge. Rather than a lack of care or investment, researchers found that care practices evolved for the specific Andean way of life are not visible to outsiders. Some health professionals express that rural mothers have a reduced capacity to understand recommendations, are not interested, or do not love their children. In fact, mothers can distinguish between numerous types of diarrhea, or detect severity of fevers, for example, in order to choose medical or traditional remedies, combining both types of knowledge. They remember nutrition messages and request more information. However economic constraints and a heavy agricultural workload prevent families from putting recommendations into practice. Mothers describe a problematic relationship with healthcare providers: they feel that neither they nor their beliefs are respected and fear being insulted. Long waits that do not always result in attention, verbal abuse and a lack of provision of clear information have been observed.

Conclusions: Adapting nutrition advice to the local context and culture (seasons, resources, traditional norms) is likely to result in better uptake. However, it is most important to reduce discrimination in social relations so that families are motivated to make use of state services.

Key words: malnutrition, discrimination, healthcare, culture, Andes.

PO3035

DETERMINANTS OF MALNUTRITION AMONG WOMEN OF REPRODUCTIVE AGE IN URBAN POOR AREAS (INDIA)

C. Combelles de Morais[1]

[1]Institute of Population and Social Research, Mahidol University, Nakhon Pathom, Thailand

Background and objectives: Worldwide around 2.5 million of children under 5 directly or indirectly die from malnutrition every year. While mother malnutrition is widely recognized as a main determinant of child malnutrition, its own causes have only be partially explored. Among 95 million of India urban poor, as high as 59% of women of reproductive age are anemic and 39% are underweight. In a population where farming opportunities are scarce and food accessibility essentially relies on market supplies, the present study aims at unveiling a comprehensive view of woman malnutrition determinants.

Methods: The sample of 2,096 women of reproductive age was drawn from the latest India National Family Health Survey (NFHS-3, 2005-2006) by selecting women living in urban poor households and not currently or recently pregnant. Multivariate binary regression was subsequently run on woman underweight and woman anemic status.

Results: Young age, lack of contraceptive pill usage, low meat consumption and lack of iodized salt usage contribute to woman underweight status (OR=1.7; 1.7; 1.4; 1.3). Lack of contraceptive pill usage, unmarried status, a recent birth, and lack of iodized salt usage constitute as many risk factors for woman anemic status (OR=2.5; 1.7; 1.6; 1.3).

Conclusions: Among urban poor, extra attention should be brought to the nutritional status of younger women - even the ones not bearing a child yet -, prevalence of contraceptive pill usage should be extended beyond the current 5%, and basics on nutrition should be broadly taught.

Key words: women, malnutrition, urban poor, underweight, anemic.

PO3036

DIETARY HABITS AND NUTRITIONAL CHANGES OF IMMIGRANTS IN THE REGION OF MURCIA

P. Palacio-Vales[1]*, J M. Rubio-Perez*[1]*, C. Perez-Iglesias*[1]*, J M. Morillas-Ruiz*[1]

[1]Department of Food Technology & Nutrition, Catholic University of San Antonio, Murcia, Spain

Background and objectives: To describe the main characteristics of dietary habits and nutritional changes of immigrants in the Region of Murcia (Spain) regarding their countries of origin.

Methods: A cross-sectional study based on nutritional education courses to immigrants of different associations in the Region of Murcia was carried out. 419 immigrants older than 18 years that live in the Region of Murcia were interviewed. Dietary habits questions and measures of height, weight, % body fat (%BF), body mass index (BMI), blood pressure (BP) and pulsations were collected. Statistical analysis was performed using SPSS 17.0 software.

Results: Age 32±10 years, 70% female. 82% live in Spain for more than two years, being the place of origin: Africa (36%), South America (44%), Eastern Europe (7%) and other (13%). Smokers (20%), alcohol intake (55%), BMI: 26.4±6.2 Kg/m2, %BF: 31±9 %, BPmax: 12.1±1.6 mmHg, BPmin: 8.1±6,5 mmHg and pulse: 72±12 ppm. 56% of the participants have gained weight from living in Murcia, 28% of these immigrants have introduced changes in the type of food consumed (significant increase in the consumption of meat, fish and legumes, and a significant decrease in the consumption of cereals), 30% have changed the meal times, 11% have increased the number of meals per day and 15% have changed the cooking way. 63% of these immigrants use boiling as first culinary technique, 8% roast, 10% frying and 7% grill. 44% of volunteers use olive oil, 42% oil seeds (sunflower or corn), 2% pomace oil and 3% other oils (sesame and soy). 8% of immigrants claim to consume mineral-vitamin supplements, 5% energy supplements, 9% other (laxatives, slimming...) and 78% do not use dietary supplements. 48% of participants drink less than 1 liter of water per day.

Conclusions: It is necessary a complete nutritional education to immigrants that come to Spain.

Key words: Immigrants, dietary habits, nutritional changes.

PO3037

DIETS2: EUROPEAN DIETETIC ADVANCED COMPETENCES- EDAC 2012

M. Konrad[1]*, A. Hörnell*[2]*, A M. Gomes*[3]*, S. Olsen*[4]*, A. de Looy*[5]

[1]FH joanneum university, Graz, Austria
[2]University of Umeå, Umeå, Sweden
[3]University of Porto, Porto, Portugal
[4]Norwegian Association of Dietitians, Oslo, Norway
[5]University of Plymouth, Plymouth, UK

Background and objectives: DIETS2 (Dietitians ensuring education, teaching and professional quality) is an EU Thematic Network bring together an active network of dietetic (and nutrition) associations and higher education institutions. The intention is to improve European nutritional health through education and practice. 'Health 2020' (WHO, 2012) calls for a new working culture fostering cooperation across Europe

to enhance healthcare necessitating a great emphasis on lifelong learning for health professionals. Advanced competence standards for dietitians, which describe the higher levels of knowledge and complex responsibilities required, have now been developed.

Methods: Invitation to access an on-line questionnaire (Lime-survey) was sent out via European Federation of Associations of Dietitians (EFAD) and DIETS2 partners in 2011. The questionnaire collected information on demographics, working environments and identified second and third cycle dietetic competences.

Results: 2030 dietitians from 35 countries over a range of occupational fields; Clinical (66%), Public Health (35%), Administrative (30%), Higher Education Teaching (20%) and Research (18%) responded. Competences identified for working at advanced level were Advanced Knowledge and Understanding of Dietetics; Dietetic Process and Professional Reasoning; Professional Relationships; Professional Autonomy and Accountability; Educator Skills; Research and Development in Dietetics and its Science; Leadership and Management of Professional Dietetics; Entrepreneurial Skills and Business Development of Dietetics. The identified advanced competences (EDAC, 2012) and their performance indicators are now accepted by EFAD for Pan-European application and form the basis for Lifelong Learning for dietitians post qualification.

Conclusions: The EDAC Framework represents the first definition of the competences required by nutrition and dietetic professionals to meet the Health 2020 agenda and provides a benchmark against which health professionals and their clients can judge their competence.

Key words: advanced competences, dietitians, lifelong learning, WHO.

PO3038

EATING HABITS OF A REMNANT QUILOMBO COMMUNITY IN A MUNICIPALITY OF BRAZILIAN NORTHEAST AFTER IMPLEMENTATION OF CONDITIONAL CASH TRANSFER PROGRAM (BOLSA FAMILIA PROGRAM)

F. Lima[1], R. Alvim[2], L. Dantas[2], S. da Silva[2], M. Salgado[2]

[1]Universidade Federal da Paraíba, João Pessoa, Brazil

[2]Universidade Federal de Sergipe, São Cristóvão, Brazil

Background and objectives: Quilombo communities are social groups descended from fugitive black slaves, who escaped from captive conditions. These individuals formed traditional communities that have a peculiar way of survival, aiming environmental sustainability and preservation of their cultural identity. This study aimed toidentify the eating habits of a remnant black quilombo community at the state of Sergipe, Brazilian Northeast , after the implementation of Bolsa Familia Program.

Methods: Cross-sectional study with 68 families living in the community of Rua da Palha, Sergipe. A food frequency questionnaire about some food groups was applied to identify their eating habits and changes in diet. It was also asked if they are or not benefited from Bolsa Família project. The beneficiaries were asked about possible changes in diet after the implementation of the government program. Descriptive statistics were used to characterize the population.

Results: It was observed that the main foods daily consumed by the population studied were: rice, beans, bread, and the group of oils and fats, coffee and tea. This shows that this community continues to consume foods that are considered traditional in Brazilian diet. It was observed that after receiving the Bolsa Família benefit, the families had a better access to foods traditionally consumed, but also, it was introduced industrialized foods, like cookies, cakes, sugar and pasta. Low intake of fruits and vegetables were stated by this population.

Conclusions: The Bolsa Familia Program can help to promote nutritional food security, but after its implementation the population has also increased the acquisition of high-calorie and low nutritional value food. The implementation of nutritional education programs would support this community to better food choices and the maintenance of their cultural identity, expressed in its food practices.

Key words: traditional communities; food consumption; food; government program.

PO3039

PREVALENCE OF OVERWEIGHT AND OBESITY IN SECONDARY SCHOOL STUDENTS IN NEGARA BRUNEI DARUSSALAM

F. Yassin[1], P. Vlachou[1], A. Garcia[1]

[1]Human Nutrition, School of Medicine, College of Medical, Veterinary and Life Sciences, University of Glasgow, Glasgow, UK

Background and objectives: Childhood obesity in countries undergoing rapid economic growth is a public health concern. Brunei Darussalam is experiencing increasing numbers of overweight children at primary school age but there is little information about the nutritional status of secondary school children. The aim of this study was to estimate the prevalence of overweight and obesity in secondary school students and to investigate associated factors such as dietary habits and physical activity.

Methods: This was a cross-sectional study in a representative sample of 95 Brunei students aged 13-16 years recruited from 15 public secondary schools in Bandar Seri Begawan. Ethical approval was obtained from University of Glasgow and from local education authorities. Height and weight were measured using standard procedures. Information on dietary habits and physical activity was obtained using self-reported questionnaires. BMI was calculated using z-scores. The relationship between BMI, gender, dietary habits and PA was analysed using Chi square analysis, one way-ANOVA and Kruskal-Wallis tests.

Results: Forty four percent of students were classified as overweight and from these 22% were obese. There was an increasing trend in eating out and of using convenience foods and takeaways among both normal weight and overweight children but no significant associations with BMI-z-scores were seen. This may have been due to misreporting and small sample size. Most students were moderately active but none reported high levels of physical activity, although females were significantly more physically inactive than males ($p<0.05$).

Conclusions: There is an alarming prevalence of overweight children in this population. The diet of Bruneian secondary school students is shifting towards unhealthy eating patterns and there also is a lack of physical activity. Nutrition and health awareness programmes to improve the diet and lifestyle factors of the secondary school students are needed.

Key words: body mass index, adolescents, physical activity, dietary habits.

PO3040

ROLE OF NUTRITION EDUCATION TO OVERCOME FOOD TABOOS AND IMPROVE IRON TABLETS DEMAND DURING PREGNANCY IN ETHIOPIA: WONCHI DISTRICT

T M. Cherkos[1], T. Hailemichael[1], S. Sinamo[2], M. Loha[2], L. Woldeyes[1]

[1]World Vision Ethiopia
[2]World Vision International East Africa Region

Background and objectives: In most developing countries mothers avoid certain foods in fear of big baby and difficulties associated with it during labor and delivery. This also affects uptake of nutritional supplements such as iron tablets and intake of nutritious foods. To assess the impact of World Vision Ethiopia, in partnership with district ministry of health, on nutrition education in nutrient rich foods intake and iron tablets demand among pregnant women in rural communities in Ethiopia.

Methods: A pre and post intervention cross sectional study was conducted using Lot Quality Assurance Sampling (LQAS) method. Ninety sampled pregnant mothers were taken and all of them participated in the survey. A total of 122 and 110 children were assessed for anthropometry at the start and end of the study respectively. In addition, focus group discussions were conducted with the beneficiaries. Trained voluntary community health workers conducted the nutrition education on importance of taking nutrient rich food and iron intake during home visits and nutrition education sessions in the course of the program.

Results: The proportion of mothers that avoid nutrient rich food stuffs such as milk, meat, eggs, potatoes and sweet potatoes have reduced from 90% to 40%. Moreover, the proportion of mothers who received iron tablets has increased from 5% to 32.6%. The prevalence of underweight (weight-for-age Z score <-2SD) has reduced from 27.1% to 22%. Focus group discussions revealed that nutrient rich food intake as well as mothers' demanding for iron tablets and taking it has improved in the community.

Conclusions: nutrition education that targets barriers can improve the nutrient intake among pregnant women. Community based nutrition education needs to address barriers to significantly reduce the burden of malnutrition in the community.

Key words: nutrition education, iron intake, nutrient rich food, pregnant women.

PO3041

EFFECT OF ENDOGENOUS ENZYMES ON COOKING MIXED RICE AND BARLEY AND ITS IMPACT ON NUTRITION

M. Tsuyukubo[1], M. Kasai[1]

[1]Department of Nutrition and Food Science, Graduate School of Humanities and Sciences, Ochanomizu University, Tokyo, Japan

Background and objectives: Barley grain contains dietary fibers which is getting much attention for its health benefits. There are few chemical changes in components during cooking. The purpose of this study was to examine the characteristics of barley enzyme, and clarified the effect of enzymes on cooking mixed barley and rice and its impact on nutrition.

Methods: Hydrolysis activity of crude enzymeextracts from 60% milled barley and 90% milled rice to soluble starch, barley starch, and rice starch was examined in the range of 4-80 °C.Model experiments using crude enzyme extracts in a mixture of barley and rice during cooking were performed. Activitywas measured at 50 °C and 60 °C using a mixture of rice and barley starch as substrate. Sample flours were separately incubated at 30-80 °C, and amount of sugars were measured. The amount of reducing sugar generated was measured when the barley crude enzyme extract was added to the rice flour and

incubated. Barley was soaked at 50 °C and water absorption, texture of cooked barley was measured.

Result: Barley crude enzyme extract at the optimum temperature of around 50 °C, produced maltose mainly, but rice crude enzyme produced a large amount of glucose and at an optimum temperature of around 60 °C. Barley with rice starch mixture as substrate, in which case action of mixture of two crude enzyme extract, generating reducing sugars and glucose were higher than the theoretical value calculated from the activity of each enzyme. When barley was cooked after soaking at 50 °C, water absorption and generation of reducing sugar was enhanced.

Conclusions: Cooking mixed barley and riceresulted in the interaction of each enzyme thatincreased the generation of sugar compared to cooking separately.

Key words: Enzyme, barley, rice, starch degradation, nutrition.

PO3042

A SURVEY OF NEW YEAR CEREMONIAL DISHES IN JAPAN PART. 2. OSECHI-RYORI

M. Fuchigami[1], H. Kuwada[1], K. Ishii[1], Y. Kimura[1], C. Takahashi[1], S. Hiramatsu[1],

[1]Department of Nutrition and Life Science, Fukuyama University, Fukuyama, Hiroshima, Japan

Background and objectives: Japanese people have usually prepared special dishes called osechi-ryori for the New Year. However, this custom is disappearing. Nowadays, many people buy ready-made osechi dishes at stores instead of cooking them at home. Thus, the objective of this study is to investigate the eating habits of traditional new year dishes.

Methods: This survey was conducted by the Japan society of cookery science: A survey of ceremonial and ritual meals in Japan. Subjects were 24,858 living in 47 prefectures. The intake of typical new year dishes such as kobumaki (boiled sea weed), kinton (mashed sweet potato) , nisime (simmered vegetables), namasu (vinegared vegetables), datemakitamago (rolled omelet mixed with fish paste), kamaboko (fish cake), fish and meat dishes were studied. Intake frequency was surveyed by a questionare whereby they could choose only one of the following 4 categories: 1. eaten every year; 2. eaten sometimes; 3. eaten only recently, 4. now eating less. Intake during the present and past was choosen for these 5 categories: 1. cooked and eaten; 2. presented then eaten; 3. bought and eaten; 4. eaten at parents or relatives; 5. eaten at a restaurant, and when the date/time changed was surveyed.

Results: The osechi-ryori which was eaten every year, some times, recently, or now eaten less were 70~90%, 8~22%, 0.4~2.5% and 1.6~6.4%, respectively. The osechi-ryori cooked and eaten at home was greatest to least; nisime 67.4% > namasu 61.9% > meat dishes 55.1% > kinton 39.4%, respectively. The osechi-ryori bought was kamaboko 68.7% > datemaki 49.2% > kobumaki 46.2% > kinton 39.2%, The number of people who ate at parents or relatives or ate at restaurants was 13~15% or 1~2%, respectively.

Conclusions: Cooked, presented or bought osechi-ryori was eaten at home or at relatives.

Key words: Ceremonial meals, Japanese new year dishes, osechi-ryori, eating habits.

PO3043

RELATIONSHIP BETWEEN THE FOOD MAPPING AND SELF-EFFICACY AND BEHAVIOR ON COOKING AMONG JUNIOR HIGH-SCHOOL STUDENTS IN THAILAND AND JAPAN

J. Fujikura[1], S. Muto[1], H. Ikeda[2], Y S.Yoshimoto[3], K. Kanbe[2], K. Horibata[1], H. Nakayama[4], O. Morikawa[5], S. Boonyaritichaikij[6]

[1]Faculty of Nutrition,Kagawa Nutrition University,Saitama,Japan
[2]Department of food and nutrition,Nihon University,Shizuoka,Japan
[3]Faculty of Human Sciences,Tezukayamagakuin Univerisity,Osaka,Japan
[4]Information and Arts Department,Tokyo Denki University,Saitama,Japan
[5]National Institute of Advanced Industrial Science and Technology,Ibaraki,Japan
[6]Department of Family Medicine,Chaing Mai University,Chaing Mai,Thailand

Background and objectives: The distance learning program of food safety and food hygiene education was conducted among Japanese and Thai junior high-school students for three years from 2009 to 2011. Relationship between the food mapping surveys before and after the lessons and self-efficacy and behavior on safe cooking is studied.

Methods: All subjects were the third-year students of junior high-schools in Japan (95 students: 56 boys and 39 girls) and Thailand (105 students: 49 boys and 56 girls). The distribution patterns were categorized by six according to the position on the x and y axes. The six nutritional types were determined from the nutritional characteristics of the foods on the first quadrant. Chi-square tests and cell residual analysis were applied to the patterns by country and nutritional types. The answers to the cooking behavior questionnaires regarding the five items of knowledge, interest, subjective norm, self-efficacy and behavior were scored and factor analysis was applied. The

graphs of mean factor scores of each attribute were analyzed by country and sex, BMI, pattern and nutritional type.

Results: The statistically significant was as shown in the patterns by country ($p<0.01$). In Japan, P.L. (Positive linear concept) pattern was 15.8%, E.V. (Every food valuable) was 42.1% and N.U. (Negative unbalanced) was 23.2%. In Thailand, P.U. (Positive unbalanced) was 64.8%. As for the mean factor scores of each attribute, oberweight and underweight students had high scores in interest and self-efficacy and low behavior scores. The Thai girls, P.U. pattern, the well-balanced type had high scores in behavior and self-efficacy. P.L. and E.V. patterns had high behavior scores. The unbalanced pattern and the fast food type had low scores in behavior and self-efficacy.

Conclusions: The students of a positive thinking for eating and well-balanced type had high scores of interest, self-efficacy and behavior about cooking.

Key words: food mapping, nutrition concept assessment, cooking behavior, self efficacy.

PO3044

THE CHANGES OF DIETARY HABITS ASSOCIATED BONE DENSITY IN YOUNG CHILDREN IN MONGOLIA

P. Mejeenov[1]

[1]Department of Nutrition, Food and Biotechnology School, Mongolian University Science and Technology, Mongolia

Background and objectives: Mongolian traditional culture of food consumption, habits and food technology are very different from modern Mongolians. Mongolians had very deeply knowledge about healthy eating and healthy life, but Mongolians changed food consumption and habit to western way in last 20 years. These changes directly associated epidemiology of life style related disease in Mongolian children and adult. One of lifestyle disease such as osteoporosis has origins in childhood, and both are affected by dietary intake and physical activity. Our objective was to identify dietary patterns related to bone density in elementary school children during the age period of 7-9 y. Two-group (total of 100 children) randomized controlled trial.

Methods: Study at baseline and at 1, 3 months included 24-hour recalls diet, and bone density measured (BQI-bone quality index) by bone densitometer Sonost-3000 as ultrasound for beginning and ending of intervention.

Results: The result of 24 recall survey shown that calcium daily intake of all children's (80%) was 250-500mg. For experimental groups, we suggest high calcium intake diet though 3 months. A dietary pattern characterized by a high intake of dairy products was related to high bone density ($p<0.05$).

Conclusions: Diets calcium rich in dairy product such as hot cow milk, curd, aaruul (it means traditional diary product), and traditional bone soup can lead to healthy bone mass accrual in young children.

Key words: dietary habit, children, bone density.

PO3045

ASSESSMENT OF HEALTH AND NUTRITIONAL STATUS AND ENERGY EXPENDITURE OF POSTMEN, BUSDRIVERS AND HOUSEMAIDS IN MUMBAI CITY, INDIA.

J. Madan[1]*, P. Jain*[1]*, A. Mone*[1]

[1]Department of Food and Nutrition, SVT College of HomeScience, SNDT Women's University, Mumbai, India

Background and objectives: Diversity of occupation can have a bearing on the nutritional needs and lifestyle related factors of a given population. Female housemaids, postmen and government bus drivers are a very important segment of workforce in India with varied levels of physical activity and nutritional challenges. There is a felt need to generate database of these populations to sensitize on nutrition priorities and plan intervention programmes.

Methods: The present study was an observational cross sectional study of a total of 210 housemaids, postmen and bus drivers from different suburbs of Mumbai.The variables of the study included anthropometry, energy expenditure and dietary information using standardized and customized pretested tools.

Results: The population studied related to low and middle socioeconomic strata. The majority of housemaids had food insecurity and their average nutrient intake was 50 % of the RDI for all the nutrients. The dietary pattern of postmen and bus drivers was also found to be inadequate and showed excess consumption of fats. Low consumption of milk, dairy products, fruits and vegetables was observed in all the groups. The levels of physical activity, lifestyle pattern stressors and medical problems, varied in different groups.

Conclusions: Understanding nutritional needs and lifestyle concerns of specific occupational groups will help plan appropriate strategies to improve their health and nutritional status.

Key words: nutritional status; energy expenditure; dietary pattern.

PO3046

QUALITY ASSESSMENT OF TABLE SALT CONSUMED BY CHILDREN AND ADOLESCENTS IN THE CITY OF RIO DE JANEIRO, BRAZIL

A. Nicolau[1], L. Rodrigues[1], F. Ribeiro[2], A. Teodoro[2]

[1]Departament of Public Health Nutrition, Federal University of the State of Rio de Janeiro, Rio de Janeiro, Brazil

[2]Departament of Food Technology, Federal University of the State of Rio de Janeiro, Rio de Janeiro, Brazil

Background and objectives: Salt has an important role in public health. However, a high amount of salt intake is related to a high intake of iodine. The exposure of thyroid gland for a long period and excessive amount of iodine may predispose the population to early development of autoimmune thyroiditis and risk of hyperthyroidism. Hence, becomes relevant to monitore the amount of iodine added to salt. The main objective of this study is describe levels of iodine in salt consumed by Brazilians.

Methods: We analyzed the levels of iodine present in 24 salt samples from 8 different brands. These samples of table salt were collected from patients selected to participate in a project to analyze the Urinary iodine. The samples were analyzed according to the technique recommended by the Brazilian Ministry of Health, in order to evaluate the amount of iodine present in the salt was consistent with the Brazilian legislation.

Results: The mandatory addition of iodine to salt determined by ANVISA (National Health Surveillance Agency) from 2003 is 20–60mg of iodine/kg of salt. All samples were in accordance with the ANVISA legislation, excepting two samples presenting an average value of 62.01 mg /kg and 18.63 mg /kg.

Conclusions: The majority of samples colected were in accordance with the legislation. This monitoring should be conducted frequently to obtain a control of the quality of the salt consumed by the population to prevent iodine deficiency without risk of diseases associated with excessive intake of this micronutrient. In result of a high consumption of salted food in Brazil, ANVISA is aiming to change the legislation to 15-45 mg /kg of Iodine added in table salt .

Key words: table salt, iodine, legislation, disease.

PO3047

NUTRITIONAL EVALUATION OF ARGENTINEAN QUINOA CROPS FROM DIFFERENT ECOTYPES

S M. Vidueiros[1], M C. Sanahuja[1], L. Dyner[2], G. Peterson[3], H D. Bertero[4], A. Pallaro[1]

[1]Department of Nutrition, Faculty of Pharmacy and Biochemistry, University of Buenos Aires

[2]Department of Food Science, Faculty of Pharmacy and Biochemistry, University of Buenos Aires

[3]PROPIA, University of La Plata

[4]Department of Vegetal Physiology, Faculty of Agronomy, University of Buenos Aires

Background and objectives: Quinoa (Chenopodium quinoa Willd.) is one of the oldest crops of the American continent and itis now of great interest to the scientific world due to its high nutritious value. Quinoa grows from sea level to the Andean highlands, so it is generally classified in five ecotypes: sea level, valley, subtropical, salar, and altiplanic. Our aim was to study the chemical and fatty acids composition of 2 different crops of Argentinean quinoa: one from northwest (ecotype altiplanic) (QN) and one from Pampa´ region (ecotype sea level) (QP); and compared to Quinoa Real (QR) (commercial quinoa from Bolivia).

Methods: Moisture, ash, fat, protein and total dietary fibre (TDF) were determined by AOAC methods. Carbohydrate content was estimated by difference. The fatty acids analysis was performed by gas chromatography.

Results: Protein and fat content (g% wb) of QP was lower than QN and QR (Protein: 11.44 vs 12.35 and 11.51; Fat: 3.82 vs 5.09 and 5.67). QP had higher TDF content (g% wb) compared to QN and QR (12.95 vs 10.68 and 11.66). Respect to the fatty acids composition, the content (%) of palmitic acid (C16:0) of QP was lower than QN (11.90 vs 18.72). QP had 10% more of linoleic acid (C18:6) than QN and QR (61.32 vs 46.41 and 50.27). Also, QP had higher content (%) of linolenic acid (C18:3) than QR (7.13 vs 5.45). Otherwise, the ratio w6/w3 of quinoa oil was 8.6 (QP), 4.9 (QN) and 9.2 (QR); and the ratio of PUFA/SFA was 6.7 (QP), 5.9 (QN) and 7.8 (QR).

Conclusions: These results are the first approach to the analysis of the chemical and fatty acids composition of different Argentinean quinoa ecotypes. They would indicate its promising nutritional quality.

Key words: Argentinean quinoa, ecotypes, fatty acids, chemical composition.

PO3048

WHAT IS FOOD LITERACY AND DOES IT INFLUENCE WHAT WE EAT?

H. Vidgen[1], D. Gallegos[1]

[1]School of Exercise and Nutrition Sciences, Faculty of Health, Queensland University of Technology, Brisbane, Queensland, Australia

Background and objectives: Globally, the food system and the individual's relationship to that system are changing in their complexity. Recent public health nutrition plans call for a re-orientation to the knowledge, skills and behaviours required to meet nutrition recommendations within this changing environment. The term "food literacy" has emerged to describe these. This research sought to empirically define this term, identify its components and model its relationship to healthy eating.

Methods: Three studies were undertaken: a) a Delphi study of food experts b) a phenomenological study of 16-25 year olds living in disadvantage and responsible for feeding themselves c) a review of existing and published interventions. Each looked at all elements of the research question. Constructivist Grounded Theory was used to analyse results. This included constant comparison of data within and between studies.

Results: Food literacy is defined as the scaffolding that empowers individuals, households, communities or nations to protect diet quality through change and strengthen dietary resilience over time. It is composed of a collection of inter-related knowledge, skills and behaviours used to meet needs and determine food intake. Eleven components were identified and grouped into four domains: planning and management, selection, preparation and eating. Food literacy supported healthy eating through improving certainty, choice and pleasure. The strength of this relationship was affected by the social determinants of health, in particular their influence on local food environments and early childhood experiences with food.

Conclusions: A shared understanding of the term food literacy, what it includes and its relationship to nutrition, are important foundations to inform investment, action and further research.

Key words: food literacy, food preparation, skills, knowledge.

PO3050

A STUDY ON THE CONSCIOUSNESS OF THE YOUNGER GENERATION OF THE RICE CONSUMPTION AND THE SUCCESSION OF JAPANESE FOOD CULTURE

T. Shigenobu-Kishimoto[1], H. Li[1], E. Kitagawa[1]

[1]Department of Nutritional Science, Okayama Prefectural University, Kuboki 111, Soja, Okayama, Japan

Background and objectives: The consumption of rice has been reduced by half since 1962 in Japan. At the beginning of the New Year, Japanese eat glutinous rice cakes ('mochi') in soup with vegetables or fishes, called 'zouni'. In order to study the consciousness of the younger generation of the rice consumption, we planned a questionnaire survey of the consciousness of university students and older consumers.

Methods: We conducted (1) a questionnaire survey of university students' consciousness that focused on the frequency of eating rice in a week, the most favorite staple food in school lunch, the awareness of rice flour food, and the frequency of eating 'mochi', and (2) a questionnaire survey of older consumers' consciousness of eating 'mochi'. We analyzed the data using SPSS (19.0).

Results: The average frequency of eating rice as a staple food was 3.08 times for breakfast, 5.46 for lunch, and 5.66 for dinner in a week (n=178). The survey found that gender and family situation influenced the rice consumption behavior. Many students answered the most favorite staple food was rice in elementary school lunches (45.7%, n=175) and in junior high school lunches (44.7%, n=94). Many students (29.9%) have eaten 'zouni' only January 1-3rd (n=177). The consciousness of university students was compared with older consumers in terms of cooking 'zouni'.

Conclusions: The present study resulted in many students did not eat rice as a daily staple food, especially for breakfast, and had no customs to eat 'mochi' except 'zouni' in January. It suggested the close relations between a decrease of the rice consumption and non-succession of Japanese food culture to the younger generation. We discuss how to educate the consumer systematically, in school, with regard to the healthy dietary habits and environmental sustainability in Japanese food culture.

Key words: rice consumption, food culture, rice cake.

PO3054

WE LIKE TO EAT TURKISH KEBAP, YOGURT, HOMEMADE SOUP

E . Aksoydan[1], P. Kývanc

[1]Department of Nutrition and Dietetics, Baskent University, Ankara, Turkey

Background and objectives: The purpose of this study was to identify the factors that affect the food selectivity like cost, flavor, appearance, smell, nutritional value, habituation, psychological state and body weight.

Methods: One hundred fifteen voluntary people (41.7% male and 58.3% female), living in Çankaya district of Ankara, Turkey participated in this study. Data was collected with a questionnaire.

Results: The mean age, and body mass index of the participants were 37.8 ± 11.9 years, and 24.6 ± 4.6 kg/m2 respectively. About sixty two percent of the participants thought that they were eating a well-balanced diet. 77.4% of them did not have a chronic disease. 65.4% of the participants who had a chronic disease imported that their disease had a selective effect on deciding which type of foods. According to the participant, the meaning of eating meal for 39% of them it was supplying the daily need, for 37% of them it was healthy life, for 14% of them it was always an activity that was giving happiness and enjoyment, for 5% of them it was an activity when they were stressful conditions, for 4% of them it was the reason for living. The most selected purposes of eating meal were protecting their life (46%), leading their lives (36%) and enjoying (9%) respectively. The participants felt happiest while they were eating meal with their family (88. 7%). The first three factors that affected the food choice; palatability (51. 3%), nutritional value (22.6%) and appearance (19.1%). The foods and beverages that participants especially like consuming were cultural foods like Turkish kebap (90.4%), homemade soup (89.6%) yoghurt (85.2%), and black tea (82.7%) respectively.

Conclusions: In this study maintain healthy life, palatability and tradition were priority areas on food choice.

Key words: food choice, palatability, nutritional value, cultural foods.

PO3055

FOOD CONSUMPTION PATTERNS IN EUROPEAN UNION

M. Kwasek[1]

[1]Department of General Economics, Institute of Agricultural and Food Economics - National Research Institute, Warsaw, Poland

Background and objectives: European Union Member States are quite diversified in their level and structure of food consumption. This results both are from economic and noneconomic factors, mainly geographical, which gear the main food production and fishery development directions, as well as cultural factors that include dietary habits. Significant impact on the shaping of food consumption profile has been observed in the case of dietary recommendations promoting rational (healthy) diet and new consumer behavior profiles. The aim of the paper was the identification and characterization of patterns of food consumption in European Union.

Methods: For the identification of patterns of food consumption taxonomy methods – cluster analysis was used. Grouping of 27 countries of EU according to food consumption patterns was carried out using Ward's hierarchical agglomeration method. Each country was characterized by 14 diagnostic variables.

Results: As a result of this grouping, 8 clusters have been identified. In those eight clusters eleven different food consumption patterns have been identified: Luxembourger, Maltese-Portuguese-Lithuanian, British-Irish, Italian-Greek, Spanish-Cypriot, Polish-Latvian, Hungarian-Czech, Slovakian-Bulgarian, Swedish-Finnish, French-Belgian and German-Austrian.

Conclusions: Among the analyzed food consumption patterns there is no one pattern which would meet all dietary recommendations of the Food and Agriculture Organization of the United Nations (FAO) and World Health Organization (WHO). In every single one of these patterns there are both insufficiencies in desired food products and the excess of inexpedient products, which have adverse impact on human health.

Key words: food consumption patterns, health, European Union.

PO3056

THE EFFECT OF WOMEN'S MANAGEMENT OF HOUSEHOLD INCOMES ON CHILD NUTRITION IN TWO RURAL COMMUNITIES OF NICARAGUA

H. Marselles[1], J. Vincent[1], J F. Huneau[2]

[1]AgroParisTech, INRA, UMR SADAPT, 16 rue Claude Bernard, Paris, France

[2]AgroParisTech, INRA, UMR PNCA, 16 rue Claude Bernard, Paris, France

Background and objectives: Undernutrition remains an issue in Nicaragua, with approximately 23% of pre-school age children (PSAC) suffering from chronic malnutrition. Many studies suggest that intrahousehold gender relationships, dynamics and inequalities are crucial for child nutrition. In this regard, evidence from a variety of contexts indicates that women's income has a greater effect on PSAC nutrition than men's income. However, who manages the income may be more important than who earns it. This study in two communities in Nicaragua, explores whether intrahousehold income allocation and control is associated with child nutrition.

Methods: The insights from this study are derived from a 2-year intrahousehold gender-sensitive research that applied qualitative and quantitative methods. Information was gathered from all households (148) in both communities, whereas detailed inquiries were carry out in 30 households. The trust relationship established with those interviewed and the use of more than one information collection method (triangulation), assured the trustworthiness of the qualitative data gathered.

Results: Greater control over the family budget by the mother was associated with improvements in height-for-age Z-score and protein adequacy of PSAC. Qualitative data gathered showed that these results were linked to the micro-strategies adopted by women in food insecure families to cope with food scarcity. Women are more likely to manage the family budget aiming at food and child welfare, while men appear more focused on their personal consumption.

Conclusions: Findings show that Nicaraguan rural women's position in the household is more closely linked to the nutritional status of children than men's. Although results from gender and intrahousehold analyses are specific to cultural, social, and institutional settings, which precludes generalization, the present study emphasize the importance that must be given to gender issues in development programs and policies working to eradicate malnutrition.

Key words: Nicaragua, income allocation, gender, malnutrition, intra-household research.

PO3057

FOOD AND NUTRITIONAL EDUCATION AS A CONFRONTATION OF OPPRESSION AT BASIC SCHOOL

S. Prado[1], M. Carvalho[2], L. Colares[2], M. Ribeiro[3], A. Salles[2]

[1]Núcleo de Estudos Sobre Cultura e Alimentação (NECTAR), Instituto de Nutrição, Universidade do Estado do Rio de Janeiro, Rio de Janeiro, Estado do Rio de Janeiro, Brasil

[2]Instituto Josué de Castro, Universidade Federal do Rio de Janeiro, Rio de Janeiro, Estado do Rio de Janeiro, Brasil

[3] Masan Serviços Especializados

Background and objectives: To share educational interests in the education activities of daily living expected in the basic school curriculum can provide local solutions for the Brazilian historical nourish nutricional transition problems. The feeding in this prospective does not come down to a narrow realm of the Nutrition course, but to a social and humanitarian practice. In this study, the nourish and nutritional education strategy turns to fragilized situation of a school community. The objective is to value the local dieting conditions with comprehensive resignification, exceeding the hygienist trait, considering that the social relations, from generation to generation, keep great possibilities to behavioral and life style changes. There is not a right pattern of eating or thinking. The right pattern is an act legitimized by social practice. The Paulo Freire's theory against the oppression (1997) faces the idea of an eat well pattern, as well as the misleading free choice or food diversity of the large urban centers.

Methods: This work was placed as an elective weekly discipline additional to the basic curriculum in an experimental kitchen at the municipal school João Goulart at the community of Pavão/Pavãozinho/Cantagalo in Rio de Janeiro. The strategy is based on enhancing culture of the entitlement - a political instrument of social inclusion and a permanent reconstruction of a collective project of welfare with local solutions aimed to equity, intersectoriality, social participation, interdisciplinarity, socialization and sustainability.

Results: The result is a collection of artistic activities such as paintings, drawings, poetry, narratives, recipes and rules of coexistence jointly build around nourish.

Conclusions: The guiding thread of this work is the daily exercise of nourishing resignification guided to autonomy aiming to transform the destiny of an oppressed and symbolically violated population, recovering this destiny as a collective welfare project at school.

Key words: basic school, theory against the oppression, nutritional education strategy.

PO3058

CAN THE NORDIC DIETARY POLICIES BE A ROLE MODEL?

P. Baardseth[1], E. Risvik[1]

[1]Nofima , Norwegian Institute of Food, Fishery and Aquaculture, PB 210, NO-1431, Ås, Norway

Background and objectives: Nutritional policies in the Nordic countries (Norway, Sweden, Denmark, Finland, Iceland, Ferroe Islands, Greenland and Åland) have long time been founded on evidence based models for nutritional recommendations and dietary guidelines. To combine the evidence based recommendations and increased food cultural awareness will create a complete model for influence consumer behaviour towards Nordic food. Nordic Council of Ministers (NCoM) has supported a program called New Nordic Food (NNF) aimed to influence food culture in order to promote positive changes in eating behaviour. The focus in this presentation will be on the activities aimed at increasing a positive attitude towards Nordic food culture, health and welfare.

Methods: NNF programme with the background in evidence based nutritional recommendations and dietary guidelines, has established a series of activities in order to strengthen food culture using Nordic food and hereby changing eating behaviour, as the third element in a complete dietary policy system.

Results: The programme has been executed in collaboration between authorities, food industries, chefs and academia in order to develop healthy Nordic food to targeted sectors and vulnerable groups such as school meals for children, SME production of food with high cultural and sensory qualities, public meals in hospitals and institutions. In addition to the NCoM programme each country has complementing activities such as the OPUS programme in Denmark and "Matlandet Sverige" in Sweden.

Conclusions: The concept of NNF is an innovative approach to traditional foods combined with strong health perspectives and an ethical production philosophy. The interdisciplinary cooperation is the key success factor in the Nordic model with main focus on food, nutrition and welfare.

Key words: Nordic food, eating behaviour, welfare.

PO3059

FROM GREECE WITH USEFUL KNOWLEDGE?

A S. Ask[1], I. Aarek[1]

[1]Department of Public Health, Sport and Nutrition, Faculty of Health and Sport Sciences, University of Agder, Kristiansand, Norway

Background and objectives: The course ERN900 The Mediterranean Diet (10 ECTS), for students and teachers has its roots in Lesvos in Greece where the University of Agder has a course- and study center in a restored monastery. The course has been taught in a Mediterranean country, mostly in Greece. The evaluation of these courses has been very positive, but we are uncertain about what benefit students experience after their return home. Our questions are: What useable knowledge do students get from a course in the Mediterranean Diet? How do students "translate" their knowledge about Mediterranean diet to Norwegian conditions? Is it useful to teach students about the Mediterranean diet in a Mediterranean country?

Methods: In the presentation we describe the term "Mediterranean Diet" and why this diet is regarded as being very healthy. The course description for ERN 900 The Mediterranean Diet will be presented. To answer our questions, we have studied the students´ exam papers from 2006-2012. In addition we have looked at the evaluations of the courses. A survey among the participants of courses held from 2006 until 2012 have been conducted and the results analyzed. Past participants were asked what benefit they have subsequently had after attending the course in Mediterranean Diet.

Results: Most of the participants feel that they have befitted from the course. The themes of the exam papers and the results from the survey show that the students have reached the learning outcomes listed in the course description.

Conclusions: From the survey we see that the teachers use their knowledge in teaching and most of the participants use it in their daily life. The exam papers show that the students are able to translate their knowledge about Mediterranean Diet to Norwegian conditions.

Key words: Mediterranean diet, health, learning outcomes.

PO3060

DEVELOPMENT AND VALIDATION OF INTEGRATED-KOREAN DIETARY PATTERN SCORE

K W. Lee[1], C E. Chung[2], M S. Cho[1]

[1]Department of Nutrition Science and Food Management, Ewha Womans University, Korea
[2]Department of Food and Nutrition, Ansan University, Korea

Background and objectives: The purpose of this study was to develop an integrated conceptual index capable for assessing and measuring more precisely the Korean dietary patterns based on Korean food culture.

Methods: The Integrated-Korean Dietary Pattern Score (I-KDPS) was developed as an index for assessing Korean dietary patterns and diet quality. I-KDPS is composed of 7 categories and scored along a 60 point scale for the purpose of measuring ¡®the level of balanced and adequate Korean food consumption¡¯ on the basis of Korean food culture and ¡®Traditional table setting of three side dishes'. I-KDPS was tested and verified through applying to the Korean National Health and Nutrition Examination Survey (KNHANES) data.

Results: As the I-KDPS score increased from the lowest quartile group (Q1) to the highest quartile group (Q4), energy intake and nutrient density of calcium, iron, vitamin A, and vitamin C became larger, macronutrient consumption pattern became to the recommended carbohydrate : protein : fat ratio. Furthermore, the percentage of complementary nutrients consumption of the Korean Dietary Reference Intakes (%RDA or %AI) showed significant differences among the I-KDPS quartile groups. Higher the I-KDPS was, larger the adequacy of nutrient consumption was. According to the analysis of food consumption, Dietary Variety Score (DVS), Dietary Diversity Score (DDS), and consumption patterns of food groups (DMGFV), higher the I-KDPS was, higher the diversity score of food consumption was.

Conclusions: The I-KDPS newly proposed in this study was verified as a good instrument to assess food consumption trends, quality assessment of meals, nutrient intake level, and diversity of food consumption, balanced meals, and dietary patterns for Korean people.

Key words: I-KDPS, KNHANES, Korean food culture.

PO3061

USING POSITIVE DEVIANCE TO CHANGE LOCAL FOOD PERCEPTIONS AND IMPROVE CHILD GROWTH IN A ZAMBIAN VILLAGE

C. Tse[1], F. Singogo[2], C. Phiri[2], A. Mildon[3]

[1]Nutrition Centre of Expertise, World Vision International, Mississauga, Canada
[2]World Vision Zambia, Lusaka, Zambia
[3]Independent Consultant, Toronto, Canada

Background and objectives: Child malnutrition is widespread in Zambia, and is compounded by cultural food perceptions which limit children's access to nutritious foods. The Positive Deviance/Hearth (PDH) approach, which leverages local wisdom to improve child nutrition, was piloted in Mabeka village in February 2012 by the Ministry of Health, World Vision Zambia and community members. The objective was to improve child growth by applying locally identified positive feeding and care practices.

Methods: PDH was implemented by trained community volunteers. A "positive deviant" inquiry identified local practices that positively impact child nutritional status, including consumption of foods often considered taboo. These practices were transferred to families of malnourished children through experiential learning during 12 days of "Hearth" sessions. Weights of the nine participant children were assessed at Day 1, 12 and 30 and three months after the start of Hearth, and compared to established PDH standards for weight gain.

Results: Traditional food taboos to exclude fruits and vegetables considered "round" in shape were modified by giving such foods to children as snacks during Hearth sessions. Using indigenous foods in Hearth meals and witnessing the improvements in energy level, mood and weight of their children changed caregivers' perceived value of these foods. Complementary positive practices included increased meal frequency, diet diversity, handwashing and accessing clean water. All nine children graduated from PDH by gaining at least 400 grams in 30 days. Eight children improved their classification of nutritional status, with one child moving from moderately malnourished to normal status within three months of Hearth. Mean weight-for-age z-scores (n=9) rose from -2.8±0.2 to -1.6±0.3 (p=0.00007) within three months.

Conclusions: PDH is a culturally sensitive and effective way to change traditional food perceptions and feeding practices to improve the growth of young children in rural Zambia.

Key words: positive deviance hearth, malnutrition, food taboos.

PO3062

PREVALENCE OF INFANT MALNUTRITION IN THE MOST VULNERABLE SOCIAL GROUPS IN HONDURAS

L. Fernández-Palacios[1], C. Frontela Saseta[1], C. Martínez Graciá[1], E L. Barrientos[2], R C. Raudales[2], G. Ros Berruezo[1]

[1]University of Murcia, Murcia, Spain

[2]University Pedagogic National Francisco Morazan, Honduras

Background and objectives: Honduras has a high prevalence of growth delay (32.9% in children under 5 years) that is the most common cause of short stature. A chronic food deficiency heads to a malnutrition status of proteins, energy, vitamins and minerals that is an important public health problem persistent and with a low probability of revert back to a situation of health status. Moreover, the wrong dietary habits lead to increase obesity that is included as a new nutritional disorder in Honduras. Our aim was to evaluate the infant nutritional status of children under 5 years in Honduras through anthropometric indicators such as carving weight (%), weight for height or Quetelec Index (body mass or index) supplemented with dietary inquiry.

Methods: The anthropometric parameters were evaluated using the non-probability methods in 141 Children under 5 years, health centers and public hospitals of both rural and urban areas of five departments in Honduras (Olancho (Juticalpa) Intibucá (La Esperanza) Lempira (Gracias), Francisco Morazán (Tegucigalpa), La Atlántida (La Ceiba San Francisco Urban-Rural).

Results: Malnutrition indicators in urban regions were found being around 8-15% of infants lesser than 5 years while in rural population 6-25% of infants showed malnutrition. The target population of this study also showed a high percentage of obesity (9%) in urban areas compared to the rural population (2%).

Conclusions: The prevalence of infant malnutrition and obesity in Honduras persist due to a poor nutrition education of mothers as well as an inadequate and lack of quality food and economic resources.

Key words: malnutrition, infants, obesity, Honduras.

PO3063

DIETARY PATTERNS OF BRAZILIAN ADOLESCENTS RELATED TO FAMILY INCOME

D. Behar[1], B. Slater[1], C. Borges[1]

[1]School of Public Health, University of São Paulo, São Paulo, Brazil

Background and objectives: Adolescence is a period of forming food habits that can be maintained during adulthood. Studies from different countries indicate that the dietary patterns of adolescents is limited to snacks, sodas and sugary drinks. The analysis of dietary patterns in adolescents may contribute to better understanding relationship between diet and socioeconomics factors. Our objectives are to identify dietary patterns in adolescents and correlated to household income.

Methods: The data from the Household Budget Survey 2008-09 were used. Food intake information was obtained using a 24hDR. Foods were aggregated into 23 groups. Factor Analysis (rotation varimax) used to estimate dietary patterns practiced for adolescents. Was calculated mean of score for dietary patterns into fifth of income.

Results: Were identified five dietary patterns practiced by adolescents. The first and second dietary pattern had a low prevalence for all quintiles of income. The third pattern composed by eggs, milk, fruits and oil and poor in meats, processed meats, beverages and vegetables was prevalent in the fourth income quintile. The fourth pattern consisting of eggs, milk, fruits, oils and slightly correlated with processed meats, beans, vegetables, flour and pasta was positively associated with the first income quintile. The dietary pattern 5 was positively correlated with the consumption of processed meats, beans, vegetables, flour and pasta, and negatively correlated with meats, soups, stocks and oil was found in the second and fifth income quintile.

Conclusions: The presence of healthier foods is correlated with higher levels of income. However regardless of the household income the consumption foods low in nutrients prevails in eating patterns among adolescents.

Key words: adolescents, dietary patterns, household income.

PO3064

USING POSITIVE DEVIANCE TO IDENTIFY NUTRITIOUS RECIPES FOR COMPLEMENTARY FEEDING AND TO REDUCE STUNTING IN RURAL EGYPT

G. Saleh[1,2], S. Yassin[1], J. Kavle[3], R. Galloway[3], D. Zhamed[2], M. Ramzy[2]

[1]Save The Children/MCHIP-Smart Project, Egypt
[2]National Nutrition Institute of Egypt, Cairo, Egypt
[3]Maternal and Child Health Integrated Program (MCHIP)/Program for Appropriate Technology in Health (PATH)

Background and objectives: The United States Agency for International Development (USAID)-funded Maternal and Child Health Integrated Program (MCHIP) is implementing the Smart project in Egypt that focuses on reducing stunting in children younger than two years of age.

Methods: Focus group discussions (N=300) were conducted with mothers (n=1,000), fathers (n=1,000), grandmothers (n=1,000), and key care givers of well-nourished children 0-24 months of age about infant feeding and care practices in six Governorates in Smart project areas. Three focus group discussions were conducted per village (N=100 villages). Mothers with well-nourished children (positive deviants) were identified following routine growth monitoring, where children were classified into normal, underweight, stunted, or both underweight and stunted at local community development associations. Recipes were developed based on the foods positive deviant families were feeding their children. These recipes were analyzed using the Egyptian food consumption tables and modified to fulfill nutrient requirements of this age group for protein, vitamins A and D, folic acid, iron, and zinc.

Results: While the areas where mothers resided were poor, mothers with well-nourished children were identified. The recipes for complementary foods mothers used, including Sesamina and Molassina, were more nutrient-dense than those of mothers of underweight or stunted children. Recipes were modified to increase the protein and micronutrient content, particularly for iron and zinc, with ingredients that poor women could afford. Recipes were shared with and accepted by most mothers and had a positive impact on weight gain and stunting in children.

Conclusions: Even in poor villages with high rates of malnutrition, well-nourished children can be identified and best practices on infant feeding can be identified and shared with mothers.

Key words: positive deviance, local recipes.

PO3065

FOOD CONSUMPTION CHARACTERISTICS AMONG RIVERINE SOUTH BRAZILIAN

C. Rosaneli[1,2], A L. Ribeiro[2], S. Spinelli[2], R. Rodero[2], M. Caldas[1], S. Silva[1], F. Auler[3], J. Bertoldi[4]

[1]School of Health and Biosciences, Pontificia Universidade Catolica do Parana, Curitiba, PR, Brazil
[2]Technical Course in Nutrition and Dietetics, TECPUC, Curitiba, Parana, Brazil
[3]School of Health and Biosciences, Pontificia Universidade Catolica do Parana, Maringa, PR, Brazil
[4] Pastoral Sector, TECPUC, Curitiba, Parana, Brazil

Background and objectives: Brazilian food consumption is changing in all social classes since last century. The riverine population also performs a food consumption that can be associated to obesity, hypertension and diabetes. Analyze food consumption characteristics among riverine population in Tibicanga and Poruquara south Brazilian islands.

Methods: cross-sectional descriptive study with 29 riverine inhabitants in Tibicanga and Poruquara south Brazilian islands. Demographic and food consumption data were collected. The data were analyzed in Excel software and the results were described thought frequency.

Results: All interviewees were adults, the mean age was 38.5 years. The presence of sea food distinguishes in this population (96%). Also carbohydrates are prevalent in dinner in 28% of the sample (rice, pasta and polenta (porridge made of cornmeal)). To Tibicanga and Poruquara inhabitants the manioc has been the main local source of energy and can be considered the biggest local non- animal energy source. Soda is consumed by 30% of the sample. Fish is, undoubtedly, the best and more trustful protein source in both islands. Sea food and manioc also are the main memory food, totalizing 56% of the descriptions. Although this panorama, it can be viewed that 100% of interviewees eat beans at least five days a week, excluding holidays and weekends when meat are prevalent (58.6%).

Conclusions: The food consumption characteristics among riverine population in Tibicanga and Poruquara is compatible with low-income south Brazilian riverine family choices. In this process, "restricting" ecologic and economic factors are translated in a restricted number of variables, where choices and preferences keep in motion, and are also emotional and culturally linked. Such domains include the household and community micro-politics as well as broader local and national political-economy contexts.

Key words: food consumption, nutrition transition, Brazil.

PO3066

FOOD CONSUMPTION CHARACTERISTICS AMONG SOUTH BRAZILIAN LOW-INCOME YOUTH

C. Rosaneli[1,2], F. Auler[2], S. Spinelli[2], L. Trentini[2], A L. Ribeiro[2], S. Silva[1]

[1]PUCPR, Brazil
[2]TECPUC, Brazil

Background and objectives: Diet quality, family size, socioeconomic variables and home area can interfere in Brazilian consumption. The Young Apprentice Program is intended for qualification and professional knowledge to Brazilian low-income youth. Our objective was to analyze food consumption characteristics among south Brazilian low-income youth.

Methods: A cross-sectional descriptive study with 73 youth, among 14 and 24 years old, from TECPUC Young Apprentice Professional Qualification Program. The questionnaires were self-applied during health classes as alternative evaluation. Each question was explained by the nutritionist teacher. The data were analyzed in Excel software and the results were described thought frequency.

Results: All research participants live in a high social vulnerability area in Curitiba, Paraná, and therefore are inserted in this Program. Almost two thirds of the sample live in small houses with more than four people together. The present study main finds were that 54.8% have their meals watching TV, talking on the cell phone, in front of the computer or doing their job; 61.6% uses to eat sweets every day; 66% declare having 4 or more meals per day and 47.8% refer to delay their meals in more than 4 hours; 32% drink more than 5 glasses of water/day; 60% overeat pizza and over drink soda on the weekends; 78.1% mention never have done diet to lose weight, but are not satisfied with their body.

Conclusions: Health Education may be an important tool in health risk factors prevention associated to better food choices, assuring nourishing and nutritional safety to this population.

Key words: food consumption, nutrition transition, Brazil, low-income.

PO3067

LONG-TERM EFFECTS OF A CONTROLLED MEDITERRANEAN DIET INTERVENTION ON DIETARY AND ANTHROPOMETRIC VARIABLES IN MEN AND WOMEN

A. Bédard[1,2], S. Dodin[1,3], L. Corneau[1], S. Lemieux[1,2]

[1]Institute of Nutrition and Functional Foods (INAF), Laval University, Québec, Qc, Canada
[2]Department of Food Science and Nutrition, Laval University, Québec, Qc, Canada
[3]Department of Obstetric and Gynaecology, Laval University, Québec, Qc, Canada

Background and objectives: The traditional Mediterranean diet (MedDiet) is protective against several major chronic diseases such as cardiovascular diseases and cancer. Therefore the identification of successful strategies for the long-term adherence to this food pattern is of great interest. This study investigated the long-term effects of a controlled isoenergetic MedDiet intervention on dietary intakes and anthropometric variables, with a special attention to gender differences.

Methods: Participants were 37 men (42.6±7.3y, 29.2±3.2kg/m2) and 32 premenopausal women (41.2±7.3y, 29.6±5.4kg/m2) presenting >2 cardiovascular risk factors. During four weeks, all foods and drinks concordant with the MedDiet were provided to participants. At the end of the intervention, participants received information about the Mediterranean food pattern and MedDiet recipes, with no other contact until the long-term follow-up (six months after the intervention).

Results: The Mediterranean score increased at the 6-month follow-up compared to baseline (P=0.005) with no gender difference. More precisely, participants increased their consumption of fish and olive oil and decreased their intakes of refined grains products, red meat, eggs, dairy products and desserts (P<0.05). No gender difference was found for these dietary changes, except for dairy products (gender by time interaction, P=0.02), for which only men experienced a decrease. Compared to baseline, body weight remained unchanged at the end of the 4-week intervention in both genders (P>0.05), and a trend toward a decrease was noted only in women at the 6-month follow-up (men: -0.3±3.0kg, P=0.99; women: -1.0±2.7kg, P=0.07; gender by time interaction, P=0.06). No change was observed for waist circumference.

Conclusions: We concluded that being exposed to the MedDiet for a short duration, along with few dietary recommendations/tools, promote the long-term adherence to this food pattern in both genders and may help for the long-term management of body weight especially in women.

Key words: MedDiet, gender, dietary intakes.

PO3068

THE SOCIAL DETERMINANTS OF HEALTH OF THE CHILD-ADOLESCENT IMMIGRATION AND ITS INFLUENCE ON THE NUTRITIONAL STATUS

C. Wanden-Berghe[1,2], K. Cheikh Moussa[3], J. Sanz-Valero[3,4.]

[1]Department of Pharmacy, CEU Cardenal Herrera University, Elche, Spain
[2]Home Care Unit, General University Hospital of Alicante, Alicante, Spain
[3]Department of Public Health and History of Science, Miguel Hernandez University, Elche, Spain
[4]Department of Public Health and History of Science, University of Alicante, Alicante, Spain

Background and objectives: The aim of this study is to review the most characteristic social determinants of health of the child-adolescent immigration-using a revision of the scientific literature and to evaluate its effect on the nutritional status.

Methods: A Systematic review was carried out in the bibliographic databases below: MEDLINE (vía Pubmed) y The Cochrane Library, using (MeSH) descriptors "Emigrants and Immigrants", "Socioeconomic Factors", "Cultural Characteristics", "Social Class", "Nutritional Status", "Overweight", "Obesity", "Body Mass Index", "Body Weight Changes" y "Cohort Studies". Humans limit was used. An information control quality was performed using Strengthening the Reporting of Observational Studies in Epidemiology Guidelines (STROBE). As social determinants of health, the economic and socio-demographic factors were considered to evaluate its effect.

Results: Inclusion and exclusion criteria were used for the selection of 18 studies. The protective effect of the immigrant status characterized by the alimentary culture and linguistic isolation protects the first generation of overweight/obesity risk, while due the acculturation process the second and third generations are equalized in the gain of weight to the native population. Among ethnic groups, the overweight and later obesity prevalence is higher in the Hispanic population of the USA. No relation was found-between the studies-about differences in the nutritional status among sexes and about the protective effect of food aid programs.

Conclusions: The most influential social determinants of health on the child-adolescent generation were the socio-demographic conditions, between them: the length of stay differs among the three generations identified in the studies, whereas the linguistic isolation and ethnicity are truly the impacting ones on the biological response to the change experienced by acculturation, establishing differences in nutritional status.

Key words: emigrants and immigrants, socioeconomic factors, cultural characteristics, nutritional status, obesity.

PO3069

REFLECTIONS ON HEALTHY EATING FOR THE ELDERLY IN THE CONTEXT OF THE BRAZILIAN PUBLIC AGENDA

M. Menezes[1], S. Prado[1], M. Carvalho[1,2]

[1]Núcleo de Estudos sobre Cultura e Alimentação, Instituto de Nutrição, Universidade do Estado do Rio de Janeiro, Rio de Janeiro, Brasil
[2]Instituto Josué de Castro, Universidade Federal do Rio de Janeiro, Rio de Janeiro, Brasil

Background and objectives: The rise in obesity and chronic diseases, the recent and accelerated aging process of the population and the propositions of the national policy on Food and Nutrition underlie this work. We discuss the following points: interrelationship between Nutrition and Food, health as a process which is based on everyday life and heterogeneity of aging. It is our goal to develop a reflection of what meanings inserted in the construction on healthy eating in Brazilian public agenda.

Methods: For the orientation on healthy eating for seniors, a document analysis was conducted on the documents provided by the Department of Health. These were the 'Food Guide for the Brazilian Population: promoting Healthy Eating', 'Ten steps to healthy eating' and 'Healthy eating for the elderly: a manual for health professionals".

Results: In dialogue with authors of the human and social sciences field, Sfez, Weber, Elias, Dumont, Canguilhem and Douglas, the following perspectives have been identified: accountability of individual attention regarding food and nutrition, with strong ascetic and control over the body; strong tendency towards rational and maximum reduction of the risk of disease, synonymous with healthy lifestyle; a strong emphasis on hygiene and food safety; the primacy of biomedical character of the Nutrition; and homogeneity and fragility marks as the aging process.

Conclusions: The idea of healthy eating involves necessarily, thinking about food and health. However, the documents tell us about nutrition and disease. It highlights the biomedical conditions and relegates to an economic cheaper plan, a structure social and cultural living and illness in the contemporary world. Eating needs to be thought in the mediation of biological social and cultural needs. Working from the perspective of access, autonomy, care, risk, self-satisfaction, are important concepts for a reflection of healthy eating for the elderly population.

Key words: food, healthy eating, elderly.

PO3070

FOOD AND NUTRIENT SECURITY INDICES TO MONITOR THE FOOD SUPPLY AND INTAKES FOR TAIWAN

C J. Peng[1], W H. Pan[2], M S. Lee[3], M L. Wahlqvist[4], H R. Guo[1]

[1]Department of Environmental and Occupational Health, College of Medicine, National Cheng-Kung University, Taiwan
[2]Division of Preventive Medicine and Health Services Research, Institute of Population Health Sciences, National Health Research Institutes, Taiwan
[3]School of Public Health, National Defense Medical Center, Taiwan
[4]National Health Research Institutes and School of Public Health, National Defense Medical Center, Taiwan; Department of Epidemiology and Preventive Medicine, Monash University, Melbourne, Australia

Background and objectives: To evaluate food and nutrient supply trajectories against nutrition recommendations and intakes by novel indices in order to alert to food insecurity. Taiwanese data are used for illustration.

Methods: We used Taiwan's food balance sheets from 1991 to 2010 to estimate the food/nutrient availabilities and adopted data from two Nutrition and Health Surveys in Taiwan (NAHSITs) (1993-1996 and 2005-2008) to assess food/nutrient intakes. Composite age and gender weighted food guides and Dietary Reference Intakes (DRIs) were used as references for food/nutrient needs. We multiplied food/nutrient availability-needs ratios by food/nutrient intake-needs ratios to obtain food security indices (FSI)/nutrient security indices (NSI).

Results: From 1997 to 2010, the availability for most food groups and nutrients decreased, with dairy and vegetables falling below nutritional recommendations in 2010. The mean ratios of the food availabilities to needs decreased annually from 1997 for all food items with the highest ratio drop in protein-rich foods (soy/fish/meat/egg, [-0.026]) and the lowest in cereals/roots [-0.008]. For food intakes, all except cereals/roots increased between the two surveys; only vegetables met the needs, and soy/fish/meat/egg were 1.8-fold in excess in 2005-2008. For nutrient intakes, calcium for both genders and iron for women were lower than DRIs for both surveys. FSIs were problematically low for dairy (0.21, 0.20 for 2 NAHSIT periods) and fruits (0.58, 0.83), and high for soy/fish/meat/eggs (3.18, 3.63) throughout, while that for cereals/roots fell (1.10, 0.86). For NSI, calcium (0.32, 0.37) and iron (1.22, 1.68) were of the most concern.

Conclusions: The FSI and NSI capture composite information about the food supply, intakes, and recommendations. Their combined and regular use allows food security to be monitored.

Key words: food security algorithms (FSA), nutrient security algorithms (NSA), food balance sheets (FBS), Nutrition and Health Survey in Taiwan (NAHSIT).

PO3071

CULTURAL DETERMINANTS OF UNDER FIVE YEAR CHILD FOOD CHOICE, PREFERENCE, PREPARATION AND FEEDING PRACTICES AMONG MOTHERS IN WESTERN KENYA

O. Bethwell[1], K. Silvenus[2], K. John[3], O. Victor[1], R. Nanna[4], F. Henrik[4], E. Benson[1]

[1]The Catholic University of Eastern Africa
[2]Institute of Tropical and Infectious Diseases (UNITID), University of Nairobi, Kenya
[3]Jomo Kenyatta University of Agriculture and Technology, Kenya
[4]University of Copenhagen, Denmark

Background and objectives: It is recognized that culture has a useful connection with food choice. The aim of this study was to gain a better understanding of how food choice, preference, preparation and feeding practices among mothers of infants and young children are influenced by culture.

Methods: Qualitative methods of data collection: key informant interviews, group interview and focus group discussions and observation were used to gather information on food cultural determinants.

Results: There is a rich corpus of food habits, beliefs taboos, that influences food choice and upholds some past food related traditions. Food choice, preparation and feeding are carefully done considering colour, flavour, nutritional value and safety of the child.

Conclusions: Cultural habits and tastes influencing food are embedded in social and cultural persist.

Key words: traditional foods, food habits, food beliefs, nutritional folklore.

PO3073

STREET FOOD AND ITS EFFECT ON SOCIETY AND CUSTOMER SATISFACTION IN MALANG CITY, EAST JAVA, INDONESIA

B. Freytag-Leyer[1], D. Yusuf[2]

[1]Department of Nutritional, Food and Consumer Sciences, University of Applied Sciences Fulda, Fulda, Hesse, Germany

[2]Faculty of Food Technology and Nutrition, Surya University, Banten, Indonesia

Background and objectives: In developing countries, street food vending is a very important sector to generate income. Street food vendors have an important function in society. Especially people with low income have the chance to buy adequate food. To evaluate street food vendors, socio-economic profiles of the street food vendors were compiled and the customer satisfaction of street food was gathered.

Methods: After pretests a questionnaire with 17 closed questions was used for the street food vendors and a questionnaire with 22 closed questions for their customers in Malang City. 35 street food vendors and 245 customers responded between August to October 2010.

Results: The results showed that there was an increase in the level of welfare at the vendors´street food over time. This trend was characterized by an increased average income per month and an increase of buying some consumer goods, such as motorcycle, home, furniture, and television. The customers were satisfied with the location and price of street food as being tasty. There was a stromg correlation between customer satisfaction and location, price, tasty and food safety (34 %). The level of customer satisfaction was about 66 %.

Conclusions: The survey showed that the local government should consider to support street food vendors beyond providing capital or funding for their venture. Rather training programs, cheap sources of materials, and good selling location should be provided. Supporting street food vending therefore helps many small businesses which are important in a globalized economy.

Key words: street food, vendors, customers.

PO3074

TO WHAT EXTENT ARE DIETARY SHIFTS A POTENTIAL LEVER TO REDUCE GREENHOUSE GAS EMISSIONS? A SIMULATION STUDY

G. Masset[1], F. Vieux[1], M. Maillot[1], N. Darmon[1]

[1]UMR NORT (Nutrition, Obésité et Risque Thrombotique) INRA1260, INSERM 1062, Aix-Marseille Université , France

Background and objectives: Food-related greenhouse gas emissions (GHGE) contributing around 30% of EU emissions, dietary changes may represent a major lever to achieve the 80% GHGE reduction target set by the EU 2050 roadmap. However, few studies assessed the GHGE reduction potential of dietary changes. Our aim was to simulate the maximum GHGE reduction achievable through dietary changes only, and the effect of fulfilling nutrient recommendations on the reduction potential.

Methods: A mean observed diet was derived from 1,142 women participating in the French INCA2 survey. Diet-related GHGE were estimated based on GHGE values collected in the literature for 73 widely consumed foods. Linear programming was then used to simulate three dietary changes scenarios which aimed to minimize diet-related GHGE while (i) keeping the energy intake constant; (ii) keeping weight intake constant; (iii) reaching all French nutrient recommendations. Scenarios' social acceptability was ensured by imposing maximum food quantities based on reported intakes. Nutritional adequacy of reported intakes and scenarios was assessed using the mean adequacy ratio (MAR).

Results: The observed diet's GHGE were 3,478g CO2eq/d; the MAR was 76%. GHGE were reduced by 82% in scenarios (i) and (ii). This was achieved by: (i) reducing diet weight shifting towards more energy dense foods; (ii) shifting towards low GHGE foods and lowering energy intake. These shifts led to poor nutritional adequacy, with MAR of 50% (i) and 29% (ii). Introducing the nutrient recommendations in scenario (iii), i.e. reaching a MAR of 100%, led to a much weaker GHGE reduction of 39%, mainly achieved through reduced content of meats and increased content of plant-based foods, dairy products and fish.

Conclusions: Dietary changes can help reducing GHGE but the potential is limited by nutrient needs. Further reduction of diet-related GHGE must be achieved through improvements in the food supply chain.

Key words: greenhouse gas emissions; food choices; sustainable diet.

PO3077

USING AGRICULTURE FOR IMPROVED NUTRITION: A CASE STUDY OF A USAID 'FEED THE FUTURE' INTEGRATED PROJECT IN SENEGAL

A. Buchsbaum[1], L. Du[1], P. Sene[2]

[1]John Snow Inc, Arlington, VA, USA
[2]NCBA-CLUSA, Dakar, Senegal

Background and objectives: USAID's $3.5 billion 'Feed the Future' (FTF) strategy links agricultural interventions with nutritional outcomes across 19 focus countries. USAID/Senegal's Yaajeende project, implemented by NCBA-CLUSA, is one of the longest running FTF-funded projects worldwide, and reports as early successes the production of 211 metric tons of vegetables from community gardens, a 22% increase in Minimal Acceptable Diet for 6-23 month olds, and over 100,000 people reached with nutrition messages and agricultural training. The objective of this case study was to explore promising best practices, and share them with other FTF projects.

Methods: Following a desk review of project documents, qualitative data collection was conducted in three project regions– Dakar, Matam, and Bakel. Twenty four key informant and group interviews were conducted with a total of 63 individuals, including USAID Mission staff, government stakeholders, project staff, private sector partners, and community members. Observations during 10 site visits provided additional information on implemented activities.

Results: Case study findings showed that Yaajeende staff at all levels share a common vision of 'nutrition-led agriculture', and are enabled/empowered to use private sector and government mechanisms to respond to field-identified needs. USAID Mission officers facilitate work-plan coordination between Yaajeende and a national community health project, resulting in effective cross-training and sharing among community health agents. Yaajeende's integrated approach promotes a high level of host-country buy-in among the Ministries of Agriculture and Health, and the National Nutrition Board under the Office of the Prime Minister. Contractual relationships with private sector partners are established throughout the agriculture value chains.

Conclusions: Keys to Yaajeende's success include ensuring that the multidisciplinary nature of integrated FTF projects is reflected in both project designers' and implementers' vision and practice. Projects should coordinate with a variety of in-country businesses, government service-providers, or advisory bodies focused on either agriculture or nutrition.

PO3078

CONSUMER LITERACY ON NUTRITION LABELLING AND FACTORS PREDICTING ITS USE IN MULTICULTURAL SINGAPORE

C. Au[1], S. Vijaykumar[1], M. Lwin[1]

[1]Nanyang Technological University (NTU) Singapore

Background and objectives: Nutrition labelling provides point-of-sale information to help consumers make informed food choices. In fast-paced, multicultural Singapore, there is no in-depth study on consumer literacy and use of nutrition information panels (NIP). Our objective was to determine factors that predict consumers' actual NIP use grounded in behavioral elements. Hypotheses H1: The more nutrition knowledge consumers have, the more they perceive NIP to be useful; H2: Perceived usefulness of NIP is influenced by consumers' restrained eating. H3: The more consumers perform well in mathematics calculations, the more they perceive that NIP is useful; H4: Perceived usefulness of NIP will lead to its actual use.

Methods: Shop intercept survey (N=200) in two large supermarkets targeting homemakers and office workers shoppers.

Results: Respondents comprise of Chinese (72.4%), Malays (11.6%), Indians (14.1%), and Others (2%); more participants (24.1%) are from the 25-34 years age group. Most respondents had completed primary or O/N level secondary school (47%), however they scored poorly in general nutrition knowledge. Consumers' knowledge does not significantly predict actual NIP use. Age ($p<0.01$) and restrained eating ($p<0.001$) significantly influence perceived usefulness of NIP, while gender and education do not. Consumers who follow this restraint, whether self-initiated or prescribed for image or health reasons, are more conscious in reading NIP. Numeracy skill is not a significant predictor of actual NIP use. Majority of consumers have high numeracy skills but showed limited understanding on fundamentals of NIP and reported constraints of time in grocery shopping, rendering perceived easier NIP format to assist calculations of Recommended Dietary Allowances not an effective strategy in encouraging nutrition labels use. Perceived usefulness of NIP will lead to its actual use ($p<0.001$).

Conclusions: Stakeholders involved in nutrition labelling education programs should incorporate restrained eating and diet-health consciousness in encouraging nutrition labels use.

Key words: multicultural, nutrition labelling, restrained eating.

PO3079

THE SMALLER THE PIECE THE HEALTHIER CONSUMPTION – A CHOICE ARCHITECTURAL EXPERIMENT IN BEHAVIOURAL NUTRITION

L. Rohden Skov[1], K. Schmidt[2], P. Guldborg Hansen[3], K. Lund Skov[2], B. Egberg Mikkelsen[1], F J A. Pérez-Cueto[1]

[1]Meal Science & Public Health Nutrition, Department of Development & Planning, Aalborg University, Copenhagen, Denmark
[2]Roskilde University, Roskilde, Denmark
[3]Initiative for Science, Society & Policy, Department for Marketing and Management, University of Southern Denmark, Denmark
[4]Roskilde University, Roskilde, Denmark

Background and objectives: Unhealthy dietary habits influence individual and societal well-being, since they are associated with the rise of chronic non transmissible diseases worldwide. Although several campaigns promoting healthier lifestyles have been implemented in Northern Europe, and consequently people are more conscious about nutritional recommendations, low intake of fruit and vegetables remains an issue in Scandinavia, calling for innovative ways of intervention. The aim of this pilot study was to investigate the influence of the portion sizes on the consumption levels of apples and cakes presented during the snack breaks. The hypothesis was that consumers could be nudged to healthier food choices by improving accessibility to sliced apples and make a "healthier" cake portion (small) the default.

Methods: The sample consisted of 391 people attending a congress in Copenhagen, Denmark. People were divided in two groups for snacking during breaks, and were informed that this was for logistic reasons. Two snack tables were set up, one with normal sized pieces of cake (usual sizes provided by the caterer) as well as whole apples (control N=189), and a table with halved pieces of cake as well as apples served in quarter pieces (intervention (N=202). Four students did observation using electronic counting system. Outcome was measured in quantity of cake and apples consumed.

Results: Total consumption of cake was 30.2% lower per person and apple consumption was higher by 83.9% per person in the intervention site when compared to control.

Conclusions: This pilot study supports the hypothesis that the presentation of snacks plays an important role in the consumption of fruit and cake among Danish adults. Further, it suggests that such approach could become a supportive tool set for achieving PHN objectives.

Key words: nudging, fruit and vegetables, snacks, healthy eating, consumer behaviour.

PO3080

SMALLER PLATES, LESS FOOD WASTE – A CHOICE ARCHITECTURAL EXPERIMENT IN A SELF-SERVICE EATING SETTING

K. Schmidt[2], L. Rohden Skov[1], P. Guldborg Hansen[3], A. Maaløe Jespersen[3], F J A. Pérez-Cueto[1], B. Egberg Mikkelsen[1]

[1]Meal Science & Public Health Nutrition, Department of Development & Planning, Aalborg University, Copenhagen, Denmark
[2]Roskilde University, Roskilde, Denmark
[3]Initiative for Science, Society & Policy, Department for Marketing and Management, University of Southern Denmark, Denmark

Background and objectives: With roughly one-third of food produced for human consumption lost or wasted globally (about 1.3 billion tons per year), the. impact on the environment cannot be anymore neglected. Actions at all points in the production chain are now urgent, including reductions in food waste at home, by retailers and producers. Northern European consumers are among the most environmentally concerned consumers, however, their concerns do not always translate in more sustainable food-related behaviours. Furthermore, food choices are not always rational and could be non-reflective. Hence, the objective of this pilot study was to investigate whether the size of the dishware would non-reflectively influence the amount of foods taken from an "ad-libitum" buffet and the resulting amount of waste.

Methods: Sample consisted of Danish business leaders that took part in a congress in Copenhagen, Denmark. Two buffet tables were set up on two separate floors; one with normal sized plates (usual sizes provided by the caterer, 27cm) that served as controls (N=75), and a table with smaller sized plates (24cm) that served as the intervention (N=145). Participants were allocated to each of the two floors, and informed that this was for logistic reasons. All food waste was collected in designated trash bags (different colour in each floor) and weighted in bulk by students.

Results: Smaller plates appear to have decreased food waste by 26% compared to the standard sized plates at a single serving in a self-service eating setting.

Conclusions: This pilot study supports the hypothesis that dishware size plays an important role in the amount of food wasted among Danish adults in a self-service eating setting. This finding has PHN implications: slight changes in the foodscape can contribute to sustainable food consumption goals.

Key words: nudging, buffet, sustainable consumption, environment, consumer behaviour.

PO3081

ADHERENCE TO THE MEDITERRANEAN DIET: THE PERSPECTIVE OF FUNCTIONAL FOOD CONSUMERS AMONG THE BALEARIC ISLANDS' ADULT POPULATION

A E. Özen[1], M M. Bibiloni[1], A. Pons[1], J A. Tur[1]

[1]Research Group on Community Nutrition and Oxidative Stress, University of Balearic Islands, E-07122 Palma de Mallorca, Spain, and CIBER: CB12/03/30038 Fisiopatología de la Obesidad y la Nutrición, CIBERobn, Instituto de Salud Carlos III (ISCIII), Spain

Background and objectives: In the literature, studies that examine the interest of functional food (FF) users to the healthy Mediterranean diet (MD) do not exist. The aim of this study was to assess differences in the adherence to the MD between FF users and non-users, and to compare the consumption of FFs and intake of functional components between FF users with high and low adherence to the MD.

Methods: A cross-sectional nutritional survey was carried out in the Balearic Islands adult population (16-65 years) in 2009-2010. Data were obtained from a validated semi-quantitative food frequency questionnaire, two non-consecutive 24-h recalls and a global questionnaire.

Results: The mean adherence of FF users to the MD was 51.2% (SD 14.3), while the mean adherence of FFs non-users' to the MD was 49.6% (SD 11.9). Consumption of probiotics, fibre rich bread/cookies, infusions, fish, soy milk and cholesterol lowering products was higher in adults with high adherence to the MD, whereas consumption of breakfast cereals, fruit juice, infusions and red wine was higher in adults with low adherence to the MD. Moreover, daily mean intake of functional components which are from plant origin foods, like dietary fibre, vitamin C, vitamin E, beta-carotene, folic acid was significantly higher in adults with high adherence to the MD.

Conclusions: A moderate adherence to the MD was observed among both FF users and FFs non-users'. Consumption of MD components like fruits, vegetables and whole grain cereals should be increased to obtain high adherence to the MD, thus the intake of inadequate nutrients in the diet will increase.

Key words: functional food, functional component, Mediterranean diet, adult population, Balearic Islands.

PO3082

ULTRA-PROCESSED FOOD AND DRINK PRODUCTS IN MOROCCO

S. Benjelloun[1]

[1]Consultant , Rabat, Morocco

Background and objectives: While the role of ultra-processed food and drink products in the obesity and related chronic diseases pandemics is acknowledged today worldwide, their actual contribution to the food system is yet to be assessed in most developing countries. The objective of this study is to achieve this assessment for Morocco.

Methods: Analysis of the Moroccan Ministry of Industry and Trade data on production and distribution of ultra-processed products.

Results: Various aspects reveal that ultra-processed products are widely available in the Moroccan food system :

1- The spectacular growth of related food industries (figures are in thousands Moroccan Dirhams TMAD):
   - The production value of sweet products increased importantly between 1990 and 2004: 5 times for ice cream and sorbets (TMAD29279; TMAD155944); 4 times for biscuits (TMAD215374; TMAD796413); 3.5 times for sugar-added drinks (TMAD605718; TMAD2170252) and 2 times for candies and chocolates (TMAD283869; TMAD532662).
   - The processed meat industry production value rose by 25 times between 1995 and 2004: TMAD21281; TMAD535231.

2-The visible flooding of the Moroccan markets with imported ultra-processed products (formally imported and smuggled).

3-The multiplication of ultra-processed products distribution sites: supermarkets (expanded to poor neighborhoods), small grocery stores, dried fruits shops, dairy shops, street vendors and even rural markets. In addition, there has been a steady increase in the proportion of food expenditures spent outside the home: 3.7% (1984), 4.7% (2001) and 5.5% (2007). Because of their convenience, ultra-processed products tend to constitute an important share of these expenditures.

Conclusions: The above elements show a significant presence of ultra-processed products in the Moroccan food system. This calls for the need to assess their actual intake levels among the Moroccan population and consequently, the necessity to review current nutrition education programs and revise food production and distribution legislation.

Key words: ultra-processed food and drinks products, Morocco.

PO3083

APPLICATION OF MULTIDIMENSIONAL POVERTY INDEX METHODOLOGY TO SUSTAINABLE DIETS' MEASUREMENT: DIMENSIONS AND CONCEPT

O. Ezekannagha[1], I. Akinyele[1]

[1]Department of Human Nutrition, University of Ibadan, Ibadan, Nigeria

Background and objectives: The continued existence of malnourished individuals, increased incidence of NCDs, and awareness of adequate nutrition as an indicator of development and environment has led to the clamour for the promotion of sustainable diets. This promotion though has to be preceded by identification and classification of diets as sustainable or otherwise. The objective of this presentation is to propose a methodology to measure sustainable diets/food systems especially taking into account the potentials of underutilized indigenous African foods.

Methods: Alkire's methodology for Multidimensional Poverty index (MPI) was adapted to measure the sustainability of diets/food system. Dimensions measured include food and nutrition security, cultural acceptability, environmental and economic impact; each having its own specific measurable indicators. The sustainability index (SI) includes stepwise calculation of sustainability of diets and whole food systems, proposition of different cutoffs - across dimensions of given diets and food systems. The aggregation of the sustainability of a food system is proposed as the product of multidimensional ratio (M) and intensity of sustainability (T).

Results: Based on the four dimensions measured, a food is considered not sustainable if the SI > 0.25, with the range of 0 to 1 representing 'very sustainable' to 'not sustainable'. The final aggregated SI of food system gives an index for comparing sustainability across food systems.

Conclusions: After validation, this methodology has the potential of measuring sustainable diets, with endless benefits to research and policy making regarding food system especially in the presence of neglected and underutilized food species.

Key words: sustainable diets, sustainability measurement, methodology, neglected and underutilized species.

PO3084

URBAN FIJIANS' PERSPECTIVES ON THE ACCEPTABILITY OF FRUIT AND VEGETABLES IN THE DIET

E. Morgan[1,2], P. Vatuwaqa[3], A. Dangour[1,4], K. Lock[1,2]

[1]Leverhulme Centre for Integrative Research in Agriculture and Health, London, UK
[2]Department of Health Services Research and Policy, Faculty of Public Health and Policy, London School of Hygiene and Tropical Medicine, London, UK
[3]National Food and Nutrition Centre, Suva, Fiji
[4]Department of Population Health, Faculty of Epidemiology and Population Health, London School of Hygiene and Tropical Medicine, London, UK

Background and objectives: Low fruit and vegetable intake has been found in Fiji and is a major risk factor for both micronutrient deficiencies and diet-related non-communicable diseases. The objective of this study was to explore influences on fruit and vegetable intake among urban Fijians and identify which product attributes are considered acceptable and valued. This information is needed to support the design and development of interventions and policy to address low intake.

Methods: Urban consumers living in the capital region were recruited through community and religious organizations to take part in focus group discussions. Four discussions were conducted with each of the two major ethnic groups in June and July 2012. The topic guide explored influences on the selection of fruit and vegetables and perceptions on the acceptability of various product attributes. Discussions were held in English, Fijian, and Hindi and data were analysed in Nvivo using thematic analysis.

Results: Participants identified fruits and vegetables as healthful foods and essential components of traditional eating patterns. Tropical fruits and dark green leafy vegetables were favoured by indigenous Fijian (iTaukei) participants, while a wider range of tropical and temperate fruits and vegetables were acceptable to Fijians of Indian descent. Participants in both ethnic groups found the local fruit and vegetable supply to be unreliable and often unaffordable or of poor quality. Product value and acceptability appear closely tied to price, freshness, the absence of physical damage, a pleasant retail environment, and inclusion in ethnic meals.

Conclusions: Participants expressed favourable perceptions of fruits and vegetables; however, the local supply was perceived to be sub-optimal, especially in regard to affordability and product quality. These findings suggest a public health benefit could be gained through interventions that address the underlying causes of price instability and product damage.

Key words: fruit, vegetables, Fiji, Pacific.

PO3085

SALT LEVELS IN PORTUGUESE SOUPS

C S P. Santos[1], R. Conceição[1], E. Mendes[1], R. Cruz[1], S. Casal[1]

[1]REQUIMTE, Faculty of Pharmacy, Oporto University, Portugal

Background and objectives: Soup is regarded as an important vehicle for the ingestion of vegetables, whose health benefits remain unquestionable. In Portugal, most people consume soup on a daily basis, being increasingly bought outside home in snack-bars, restaurants, supermarkets, or take-away services. However, due to the generalized use of salt (NaCl) as major seasoning, soup is consequently a major source of Na. The objective of the present work was to obtain real figures associated with the current salt content in "non-homemade" soups, in order to address its representativeness to the daily ingestion of Na in the Portuguese population.

Methods: A total of 83 soups were evaluated, being the Na amounts quantified by flame photometry, using an analytical method developed and validated for the purpose.

Results: The soups presented a mean amount of 297±76 mg/100mL for Na, equivalent to 0.75±0.20 g/100mL of NaCl showing a high variability. Indeed, the Na amounts ranged from 126 to 513 mg per 100 mL. Taking into account an average dose of 250 mL per soup, the values on Na range from 315 to 1283 mg, or from 0.80 to 3.26 g when expressed as NaCl per serving. Based on a maximum recommended daily intake of no more than 2 g of Na per day, a single soup represents around 37%, though these figures could be worse.

Conclusions: These outcomes are of extreme concern, since the consumption of non-homemade soups is increasing. Based on these findings, and aware of the recommendation to reduce salt ingestion, when consumed outside home, soup can be regarded as an important source of Na in the Portuguese population, being mandatory to implement recommendations for food producers and effective sensorial alternatives.

Key words: sodium, NaCl, soup.

PO3086

INCREASING PULSE INTAKE TO REDUCE MALNUTRITION IN TRADITIONAL PULSE GROWING REGIONS IN SOUTHERN ETHIOPIA

G A. Zello[1], S J. Whiting[1], A. Kebebu[2], A. Mesfin[2], K. Gebremichael[2], A C. Roba[2], W J. Dahl[3], J. Jaffe[4], A. Kaler[5], C J. Henry[1]

[1]College of Pharmacy and Nutrition, University of Saskatchewan, Saskatoon, Saskatchewan, Canada
[2]School of Nutrition, Food Science and Technology, Hawassa University, Hawassa, Ethiopia
[3]Food Science and Human Nutrition Department, University of Florida, Gainesville, Florida, USA
[4]Department of Sociology and Social Studies, University of Regina, Regina, Saskatchewan, Canada
[5]Department of Sociology, University of Alberta, Edmonton, Alberta, Canada

Background and objectives: An international research program (Saskatchewan & Hawassa Universities) has been established linking agro-food systems and communities to improve food security in rural Southern Ethiopia. In this project, we are investigating inclusion of pulses, which are high in protein and essential nutrients, as a vehicle to improve nutrition and food security status in vulnerable groups.

Methods: Our research methodology includes nutrition and dietary assessment, measurement of food insecurity, and the use of complimentary feeding practices and indigenous knowledge to ameliorate nutrient deficits in children, adolescent women and young mothers.

Results: In conducting baseline studies in traditional pulse growing communities, we identified undernutrition as a problem: Adolescent girls (15-19 y, n=188) had intakes of energy, calcium, vitamin C and zinc of 70%, 13%, 5% and 65% of requirements, respectively, and the prevalence of stunting was 31% (National average 30%). In another group of infants and young children (6-23 months, n=128) 38% were stunted and, except for vitamins A and B2, median intakes of micronutrients were below requirement. In these communities, and others in our study, pulses already contributed to the nutritional value of the diet, yet increased consumption would improve nutritional status. Results, however, vary when introducing complementary pulse-based foods. In the second study above, mothers showed little interest in integrating kidney bean into their complementary feeding practices even though it was regularly consumed in the household (43% once/twice monthly). Yet in another group of mothers with young children (19 months, n=169) where 40% reported providing pulse-based food to their children, a porridge of 30% added broad bean was found acceptable.

Conclusions: Pulses can effectively be used as a suitable and inexpensive addition to traditional starch-based foods;

however, com munity education in the appropriateness and nutrition value of pulses would be beneficial.

Key words: pulse-foods, malnutrition, food security, women, children.

PO3089

A SURVEY OF NEW YEAR CEREMONIAL DISHES IN JAPAN – PART 1. TOSO, ZONI AND IWAI-ZAKANA

Y. Kimura[1], K. Ishii[1], H. Kuwada[1], C. Takahashi[1], S. Hiramatsu[1], M. Fuchigami[1]

[1]Department of Nutrition and Life Science, Fukuyama University, Fukuyama, Hiroshima, Japan

Background and objectives: New Years celebrations are the most important events in Japan. Japanese people prepare toso (spiced sake), zoni (mochi rice cake soup) and special dishes called osechi-ryori for the first three days of the new year. However, this custom is disappearing. Nowadays, many people buy ready-made osechi dishes at stores instead of cooking them at home. Thus, the objective of this study is to investigate the eating habits of traditional new year dishes.

Methods: This survey was conducted by the Japan society of cookery science: A survey of ceremonial and ritual meals in Japan. Subjects were 24,858 living in 47 prefectures. The intake of typical new year dishes, toso, zoni and iwai-zakana (kuromame=sweetened black soybeans, kazunoko=herring roe and tazukuri=small dried sardines) was studied. Intake frequency was surveyed by a questionare whereby they could choose only one of the following 4 categories: 1. eaten every year; 2. eaten only sometimes; 3. eaten only recently, 4. now eating less. The intake in the present and the past was choosen for these 5 categories: 1. cooked and eaten; 2. presented then eaten; 3. bought and eaten; 4. eaten at parents‘ or relatives; 5. eaten at a restaurant, and the date/time it changed was surveyed.

Results: Meals eaten every year were toso 54.1%, zoni 94.2% and iwai-zakana 73~85%, and meals cooked and eaten were toso 32%, zoni 80% and iwai-zakana 30~48%, respectively. Zoni (91%) was cooked and eaten at home, while 44% of toso and 27~48% of iwai-zakana were bought and eaten. People whose habits changed during 1984~2004 were 52~53%. The influence of the mother or father regarding ceremonial dishes was 54.5% and 14.9%, respectively.

Conclusions: Zoni is cooked and eaten at home now. However, many people buy toso and iwai-zakana.

Key words: ceremonial meals, Japanese new year dishes, toso, zoni, iwai-zakana.

PO3090

HOUSEHOLD FOOD SECURITY IN A MOUNTAIN DISTRICT OF NEPAL

N. Subedi[1]

[1]Nepal Public Health Foundation , Nepal

Background and objectives: Interim constitution of Nepal 2006/7 has recognized food security as a fundamental human right of all citizens. National nutrition policy and strategy 2008 identified household food security as a long term strategy to ensure that all people can have adequate access, availability and utilization of food needed for healthy life. This study aimed to elucidate household food security experiences and views of key informants in a mountainous district of Nepal.

Methods: A qualitative study was conducted by means of interview to key informants of food security network at community and district level in a mountainous district, Jumla, of Nepal. Altogether sixteen key informants: community leaders, female community health volunteers, local shop keepers and members of district food security network (government officials) participated in the study. Content analysis was applied.

Results: In the analysis of experiences and views of key informants on household food security, four categories and nine sub-categories were developed: Food availability (own production, available at local market), accessibility (access to local market, affordable), utilization (food distribution and consumption practices, food values and food taboos) and sustainability (year round availability).

Conclusions: As other anecdotal studies in Nepal have shown, most of the households in Nepal are food insecure. This study adds a new perspective by describing the understanding of the people living in mountains on food security and explaining the barriers of food availability and accessibility in higher altitude. Rice was considered as the major staple and prestigious food despite other cereal. Lack of rice in local market, households and in meal was understood as sign of food insecurity in the district, quality was of not much importance. Supplementation of rice was identified as main solution.

Key words: food security, households, Nepal.

PO3091

THE MODIFICATION OF TRADITIONAL THAI GREEN CURRY PASTE RECIPES FOR HEALTH PROMOTION

S. Taechangam[1], C. Pachotikarn[1]

[1]Institute of Nutrition, Mahidol University, Thailand

Background and objectives: Thai food is the cultural heritage that represents Thai nationality. It is outstanding in the combination of tastes and the diverse of herbs and spices that

useful for health. The objective of the study was to modify the traditional green curry recipes made from green curry paste and mussaman curry paste.

Methods: The popular green curry and mussaman curry paste recipes were selected and modified using low sodium curry paste and fish sauce, modified fat coconut milk. The recipes were then standardized and analyzed for nutrient contents using INMUCAL and chemical analysis. The recipes'acceptability were tested on five hundred subjects living in Bangkok using simple random sampling. The modified recipes and health benefits were disseminated by training the group of dietitians working in hospitals.

Results: The results showed that the five most popular green curry paste recipes were Green curry spare-rib with black pepper, Fried egg and spinach in green curry , Nam-ya green curry, mussaman Kung and Kua-Guing. Sodium and fat content of the developed recipes were reduced by 60 % and 50 % respectively. However, potassium is increased about 17%-133% compared to the original recipes due to the substitution of potassium chloride for sodium chloride. The chemical analysis of nutrient contents of the modified recipes demonstrated that saturated fat was reduced by 50 % resulting from the modified fat in coconut milk. The acceptance of the modified recipes were in moderately like to extremely like. The pre-test of the training program demonstrated that majority of dietitians recognized curry paste containing antioxidants as flavonoid and polyphenol.

Conclusions: After training, they learned the additional benefits of Thai curry paste on inflammation reduction. The scientific data and research supporting the health benefits of Thai curry paste are needed to promote Thai Food to kitchen of the world.

Key words: healthy, Thai, curry paste, recipe, antioxidants.

PO3092

DEVELOPMENT OF STANDARDIZED HEALTHY RECIPES FROM THAI CURRY PASTE AND THE DISSEMINATION OF HEALTH BENEFITS TO PROMOTE THAI FOOD MARKETING

C. Pachotikarn[1], S. Taechangam[1]

[1]Institute of Nutrition, Mahidol University , Thailand

Background and objectives: Thai food is considered to be nutritious with aromatic herbs and spices ingredients. The purpose of this study was to develop the standardized Thai healthy recipes made from low sodium red curry paste and modified fat coconut milk.

Methods: The five most popular red curry paste recipes were selected and modified using low sodium curry paste, modified fat coconut milk and low sodium fish sauce. The recipes were then standardized and analyzed for nutrient contents using computerized INMUCAL program and chemical analysis. The acceptance of the developed red curry was tested on four hundred consumers in Bangkok using simple random sampling. The public relation of the developed recipes and their health benefits were disseminated by training the group of dietitians working in the hospitals and by distributing the brochure to the customers.

Results: The five most popular red curry paste recipes were Kangsubnok seekrong aun, Kangpedkai, Shushikung, Panangmoo and Todmunplakrai. The sodium and fat contents of the modified recipes were reduced by 60 % and 15 % respectively compared to the original. The chemical analysis of nutrient contents on the red curry sauce showed that saturated fat and sodium were decreased by 40 % and 60% respectively whereas potassium was increased by 60 %. These may be due to the substitution of potassium chloride for sodium chloride in low sodium red curry paste. The consumer acceptance of the developed recipes were in moderately like to extremely like. The pre-test result of the dissemination of the developed healthy recipes and their health benefits to the group of dietitians working in the hospitals demonstrated that majority of the trainees were recognized that the red curry paste contains antioxidants such as flavonoid but no awareness in polyphenol content.

Conclusions: Further research studies to support the health benefits of the developed red curry recipes are needed.

Key words: development, Thai healthy red curry paste recipes, health benefits.

PO3093

POTENTIAL CONTRIBUTION OF AFRICAN LEAFY VEGETABLES TO THE NUTRITIONAL STATUS OF CHILDREN

J. Osei[1], M. Van der Hoeven[1,2], C M. Smuts[1]

[1]Centre of Excellence for Nutrition, North-West University, Potchefstroom, South Africa
[2]Africa Unit for Transdisciplinary Health Research, North-West University, Potchefstroom, South Africa

Background and objectives: Children in South Africa, particularly those living in rural farm communities, are still affected by micronutrient deficiencies. Micronutrient rich African Leafy Vegetables (ALVs) might alleviate this hidden hunger. However, knowledge on and use of this "poor people's food" has decreased. This study assessed the potential contribution of ALVs to the nutritional status of children in a semi-rural farm community in South Africa.

Methods: Anthropometric indices, serum iron, zinc and retinol concentrations were determined in school children aged 5-13 years (n=155). Dietary intake was evaluated by three 24-

hour diet recalls. ALVs (Amaranthus cruentus, Cleome gynandra, Cucurbita maxima, Vigna unguiculata) were assessed for nutrient composition. Focus group discussions with primary caregivers gave important insights about ALVs.

Results: Stunting (11%) was the most prevalent indicator of malnutrition. Zinc deficiency (serum zinc <65 µg/dL) was highest at 74.8%. Slight deficiencies in iron (serum ferritin <15 µg/L; 15.5%) and vitamin A (serum retinol <20 µg/dL; 3.2%) prevailed. Median dietary intakes of iron, zinc and vitamin A were generally above the Estimated Average Requirement. ALVs could contribute substantially to the Recommended Dietary Allowance for these nutrients in children. Iron content of studied ALVs ranged from 1.4-3.2 mg/100g edible portions. Zinc content of the ALVs ranged from 0.7-1.4 mg/100g edible portions. The â-carotene content of the ALVs ranged from 182-314 ìgRAE/100g edible portions. Caregivers had knowledge and positive attitudes towards ALVs.

Conclusions: Although not severe (with exception of zinc deficiency), micronutrient deficiencies exist in this population. ALVs are potentially good sources of iron, zinc and â-carotene. The contribution of ALVs, existing micronutrient deficiencies, knowledge of ALVs and positive perceptions imply a potentially positive future response to interventions promoting consumption of ALVs, thereby helping to alleviate micronutrient deficiencies.

Key words: African leafy vegetables, micronutrient deficiencies, nutritional status.

PO3094

THE EFFECTS OF FOOD PREFERENCES ON BONE MINERAL DENSITY AND OCCLUSAL FORCE IN YOUNG WOMEN

M. Shirao[1], M. Hasegawa[2], Y. Inaba[3]

[1]Jissen Women's Junior College, Tokyo, Japan
[2]Kyorin University, Tokyo, Japan
[3]Jissen Women's University, Tokyo, Japan

Background and objectives: According to the National Health and Nutrition Examination Survey carried out by the Health, Labour and Welfare Ministry of Japan in 2011, 29% of women in their twenties are underweight (BMI<18.5), many of whom have an unbalanced diet. In particular, their calcium intake is insufficient, and there is concern that they will develop osteoporosis when they reach middle- to old age. The present study examines what influence of food preferences on young women's bone mineral density and occlusal force.

Methods: A survey was conducted regarding dietary preferences, including preference for vegetables, root vegetables, soybean products, milk and dairy products; how food is chewed; and exercise history. The bone mineral density was measured by ultrasound bone densitometer. The ability of mastication was evaluated by assessing the occlusal force using an occlusal pressure measuring system.

Results: The study did not find a clear relationship between food preferences and bone mineral density, but as for the connection between food preference and occlusal force, the study found that women who liked root vegetables and milk had a stronger bite. Also, in regards to how food is eaten, subjects were generally unaware of how well they chewed their food.

Conclusions: The results show the necessity of increasing the amount of green and yellow vegetables, milk and dairy products that women with low bone mineral density eat. Also, in order to improve bite strength, it seems necessary to improve the number of times one chews food as well as the firmness of the foods consumed.

Key words: bone mineral density, occlusal force, food preference.

PO3095

INDIGENOUS AND TRIBAL FOODS FOR ADDRESSING FOOD AND NUTRITION SECURITY IN TWO TRIBAL COMMUNITIES OF JHARKHAND, INDIA.

S. Ghosh-Jerath[1], A. Singh[2], M S. Magsumbol[3], P. Kamboj[1], G. Goldberg[4]

[1]Institute of Public Health-Delhi, Public Health Foundation of India, New Delhi, India
[2]Department of Biochemistry, All India Institute of Medical Sciences, New Delhi India
[3]Public Health Foundation of India, New Delhi, India
[4]Nutrition and Bone Health Research Group, MRC Human Nutrition Research, Cambridge,UK

Background and objectives: Food and nutrition insecurity is a major concern for tribal populations. Jharkhand state has 30 Scheduled Tribes; Santhal and Oraon being two most populous.; 2% of tribal population face chronic hunger; 10% experience seasonal food insecurity. Chronic energy deficiency affects 39% men and 48% women in Jharkhand. A rich habitat of indigenous foods in tribal environments have potential to promote food security, nutrition and health. Understanding food systems of indigenous peoples and strengthening them in context of nutrition and health pose unique challenges. The objective of our study was to identify common indigenous foods in two tribal communities of Jharkhand and assess their contribution in addressing food security.

Methods: An exploratory, cross sectional study on Santhal and Oraon tribes (140 households each) in selected districts and stratified by villages. Robust study protocol employing mixed methods. Qualitative methods include Participatory Rapid

Assessment, Free listing, pile sorting and ranking, FGDs and Interviews. Quantitative methods include anthropometry, 24-hour dietary recall, food frequency questionnaire, socio-demographic profile, food consumption patterns and food security assessment and lab analysis.

Results: Quantitative and qualitative tools will be piloted to complement each other. Qualitative tools will be standardized to utilize them for indigenous foods identification and identifying factors influencing their consumption. Sample collection methodologies will be standardized. Labs will be identified and one lab finalized for analysis. Food security questionnaires will be adopted to assess household food security in Indian tribal population.

Conclusions: Scientific appraisal of dietary patterns of tribal communities can help in developing systems whereby communities can be encouraged to strengthen use and knowledge of local food and food systems. This can inform policies needed to improve food security, and promote indigenous food to mitigate the nutrition transition and help prevent environmental degradation, food chain contamination, and promote long-term sustainable ecosystems and health.

Key words: indigenous foods, tribes, nutrition security.

PO3096

COMMUNITY-LED FORMATIVE RESEARCH TO DETERMINE PRIORITY NUTRITION BEHAVIORS FOR AN INNOVATIVE PARTICIPATORY VIDEO FEASIBILITY STUDY

P. Koniz-Booher[1], M. Hammink[2], A. Upadhyay[3], K. Beall[1]

[1]Strengthening Partnerships, Results and Innovations In Nutrition Globally (SPRING), Arlington, VA, USA
[2]Save the Children, Washington, DC, USA
[3]Digital Green, New Delhi, India

Background and objectives: USAID's global nutrition flagship project, SPRING, is currently collaborating with Digital Green, to adapt a community-driven, participatory video and human-mediated social and behavior change communication (SBCC) approach for the promotion of high impact nutrition practices in 30 villages in Keonjhar District of Orissa, India. The program builds on Digital Green's success in the agricultural domain. Locally produced videos showcase and celebrate innovators, facilitators and early adopters of maternal, infant and young child nutrition (MIYCN)-focused or –sensitive practices. A first phase formative research was conducted to clarify current practices, barriers and likely facilitators for the adoption of improved practices, and identify and prioritize video content.

Methods: Formative research, conducted using a participatory model in a subset of six villages, included 12 focus group discussions and 24 in-depth interviews. Nightly team meetings and debriefs facilitated a rapid initial analysis of the findings, which greatly reduced delays in programming start up.

Results: The formative research found that breastfeeding is commonly supplemented during the first 6 months, while timing, diversity, density, and frequency of complementary feeds are not well understood; and handwashing is seldom practiced before preparing or feeding infants. Mother-in-laws play integral roles in the family structure, often deciding the quantity and frequency of food that pregnant and lactating women can eat, what work must be done by whom, and how food is allocated within the family. Husbands also hold powerful positions within the household, often exhibiting interest in and support of their wives. Women get little rest during pregnancy and many foods are thought of as "harmful" to the baby and mother.

Conclusions: Formative research informed the development of nutrition training materials, served to identify priorities for the videos, and was the key to designing a successful nutrition video production, dissemination, and adoption tracking plan.

Key words: SBCC, participatory video, MIYCN.

PO3097

BLOOD PRESSURE AND FOOD CONSUMPTION PATTERN OF URBAN AND RURAL PEOPLE IN WEST SUMATRA, INDONESIA

N I. Lipoeto[1], D P. Putra[2], D. Sulastri[1], F. Jalal[1]

[1]Department of Nutrition Faculty of Nutrition, Andalas University, Java, Indonesia
[2]Faculty of Pharmacy, Andalas University , Java, Indonesia

Background and objectives: Hypertension is increasing along with obesity and changing in diet and lifestyle in Indonesia. This study was conducted to investigate the relationship between consumption of spices, fruits and vegetables to blood pressure between people in urban and rural areas in West Sumatra Province, Indonesia

Methods: This was a cross sectional study conducted in 2 cities (urban) and two municipalities (rural) in West Sumatera, Indonesia. 437 respondents were chosen systematic-randomn samplings from a list of adults (>30 years old) in the villages. Data of demography, health, lifestyle, food frequency questionnaire were compiled by interviewing the respondents. Anthropometry assessments and blood samples were taken.

Results: The study was conducted mostly to women (68%), more than 40 years old (73%). Obesity was found in 51% of

the respondents. There were significant differences in hypertension prevalence and consumption of fruits and vegetables between respondents in the rural and urban areas. No difference was found in spices consumption. There was a significant relationship between spices consumption with body weight and body mass index, but they were not significance when controlled by energy and carbohydrate intake. Significant difference was found between spices consumption and systolic pressure.

Conclusions: Consuming spices was associated with lower blood pressure. In excess of total energy and carbohydrate along with consumption of fruits and spices were associated with higher body weight and waist circumference.

Key words: spices, antioxidant, blood pressure, body mass index.

PO3098

INTEGRATING NUTRITION IN AQUACULTURE INTERVENTIONS IN BANGLADESH

A B. Andersen[1], S H. Thilsted[1], E. Khetran[2], E I. Williams[3], M. Kunda[1], B K. Barman[1], M. Karim[1], H J. Keus[1]

[1]WorldFish, Bangladesh
[2]Helen Keller International, Bangladesh
[3]SPRING, Bangladesh

Background and objectives: In Bangladesh, with rich water resources, fisheries and aquaculture are important for livelihoods, income and nutrition, especially for the rural poor. In the last 25 years, aquaculture in Bangladesh has flourished, especially polyculture of carps in ponds; and in recent years, production of tilapia and pangasius catfish. The Government of Bangladesh, together with development partners have focused on aquaculture with the aim of increasing fish production and productivity, as well as income. In light of the recent global emphasis on agriculture for improved nutrition and health, WorldFish and partners have taken steps to integrate nutrition in aquaculture interventions.

Methods: An aquaculture-nutrition linkages package with the following components is now being integrated in interventions which begin with small-scale household aquaculture: pond polyculture of carps and micronutrient-rich small fish; micronutrient-rich vegetable production on pond dykes and in the homestead; promotion of increased consumption of nutrient-rich foods, especially for women, adolescent girls, as well as infants and young children; behaviour change communication for improved knowledge and practice of essential nutrition and essential hygiene actions; gender equity; and process and impact monitoring and evaluation. Implementation of the package is carried out by field staff, lead farmers and through regular meetings with farmer groups, as well as home visits, with contact to both female and male household members; in collaboration with staff from local government and partner organisations.

Conclusions: Building on experience from agriculture-nutrition interventions which focus primarily on homestead vegetable production, and with the added benefits of increased consumption of nutrient-rich fish, we expect to see a positive impact on nutrition. As aquaculture-nutrition linkage is new; process evaluation, and thereafter impact evaluation are needed for further refinement of the package and wider dissemination.

Key words: Aquaculture-nutrition linkage, micronutrient-rich fish, Bangladesh.

PO3099

FOOD DIVERSITY AND ADEQUACY OF FOODS CONSUMED BY HIV/AIDS INFECTED WOMEN IN MUMIAS DISTRICT – KENYA

R. Shikuri[1], S. Mbugua[2], A. Mwangi

[1]Masinde Muliro University of Science and Technology, Kenya
[2]University of Nairobi, Kenya

Background and objectives: The research aims at developing a food-based intervention strategy for HIV positive women, by adopting the principal of food diversity and adequacy in their micronutrient content, using locally available and affordable food stuffs in form of a Menu prepared using a developed recipe optimized to conserve selected micronutrients necessary for Human Immunodeficiency Virus/ Acquired Immune Deficiency Syndrome (HIV/AIDS) victims. Such a strategy is critical for the HIV/AIDS victims due to the confounding nature of nutritional and health status of people living with HIV/AIDS on progression of their HIV/AIDS condition The objective of this study therefore was to find out the food diversity available to HIV/AIDS women, Their content of selected micro-nutrients, consumption patterns and nutritional and clinical status of the HIV/AIDS positive women.

Methods: This study was composed of a cross-sectional and intervention study designs. Phase one was composed of a cross-sectional study of 137 women living with HIV/AIDS in Mumias district to determine their nutrient adequacy. The P value for statistical significance test was set at <0.05.

Results: Quantitative analysis was achieved using SPSS software package. Descriptive statistics such as means and standard deviations were used to organize, describe and summarize the data on socio-economic and anthropometric measurements of the respondents. Anthropometry was used to provide valuable information on development in size and body composition of the women More than half of the women were found to consume foods that were inadequate in nutrients.

Conclusions: Given that more than half of the women were malnourished there was need to develop a Food based intervention from foods locally produced and consumed by the women and the product commercialized so as to empower these women and improve their livelihoods and health.

Key words: nutritional status, HIV/AIDS, food diversity.

PO3101

DEVELOPMENT OF A CLASSIFICATION SYSTEM FOR POTATOES

N. Hall[1,2], H. Schonfeldt[1,2], C. Van Niekerk[1,2]

[1]Department of Animal and Wildlife Sciences, University of Pretoria, Pretoria, South Africa
[2]Institute of Food, Nutrition and Well-being, University of Pretoria, Pretoria, South Africa

Background and objectives: In South Africa potatoes are produced throughout the year in 11 production regions with different agricultural practices i.e. dry land and irrigation. The aim of the project was to develop a classification system for these potato cultivars with the purpose to guide consumer choice on culinary applications, fit for purpose with easy to understand front of pack information.

Methods: Nine different potato cultivars from five production regions were evaluated. Different potato cultivars typical to each region, with Mondial and BP1 included in each trail, were assessed by means of a trained experienced sensory panel at the sensory laboratory of the Agricultural Research Council (ARC), Irene. The physical tests were conducted at the University of Pretoria and nutrient analysis was conducted by the ARC Analytical laboratory, a SANAS (South African National Accreditation Services) accredited laboratory.

Results: In order to understand which attributes contributed the most to the textural characteristics of the different potato cultivars from the different regions, the dependent and independent variables were summarized and statistically analysed (PLS). Only attributes that explained the most variances in the data, (variances from 50% and above) were included, and comprised of the sensory attributes: mealy, waxy, hardness with a knife, fracturability in the mouth, compactness, coarseness; and objective attributes: shear force resistance of raw potatoes and total starch content.

Conclusions: Three categories were identified from the PLS plot, i.e. waxy, waxy/floury and floury. Each category was described by textural characteristics and suggested cooking methods typical to cultivars that fall within the specific category. The information gained form this study has enabled the potato industry to develop a consumer education initiative by labeling and marketing potatoes according to their cultivar classification.

Key words: potatoes, cultivars, classification.

PO3102

MILK CONSUMPTION PATTENS AMONG RESIDENTS IN BEIJING

L. Ba[1], J. Zhao[1], S. Li[1]

[1]Department of Nutrition and Food Safety, Chaoyang District Centre for Disease Prevention and Control , Beijing, China

Background and objectives: Calcium deficiency is prevalent in Beijing, while milk consumption, the most important dietary source of calcium, is unknown.

Methods: A subsample of the China Health and Nutrition Survey in Beijing was used. 1,329 residents from 24 communities in 6 districts in Beijing were randomly selected by using multistage random cluster sampling schedule. Dietary data were collected with three consecutive 24-hour recalls and average consumption was adjusted to per standard person per day. Milk consumption included fresh milk, powdered milk, and yogurt, excluding milk drinks.

Results: On average, 74.4% of children aged 2-6 years, 68.4% of children and youth aged 7-17 years, 52.8% of young adults aged 18-44 years, 46.3% of adults aged 45-59 years, and 60.4% of adults aged 60 and older drank milk daily. The amount of milk consumed in each age group was 233.6 grams/day (g/d), 132.4 g/d, 75.8 g/d, 96.6 g/d, and 163.4 g/d, respectively. The proportion of milk drinkers and amount of milk consumed were higher among women than men, higher among young children and elders than youth and adults, and higher among high income people than low income people.

Conclusions: Milk consumption is increasing in Beijing, China, but the amount consumed is still much lower than the recommended level.

Key words: milk consumption, calcium intake, nutrients intake.

PO3103

FOOD-INTAKE PROFILE IN LOW-WAGED POPULATIONS IN SOUTHERN BRAZIL

F. Auler[1,2], A. Nakashima[1], C. Rosaneli[1], W. Almeida[1], L. Salles[1], A. Fadoni[1], C. Veltrini[1], R. Cuman[2]

[1]Nutrition Couse - School of Health and Biosciences, Pontifical Catholic University of Parana, Brazil
[2]Post-Graduation Program in Health Sciences, State University of Maringá, Brazil

Background and objectives: Food-intake profile has changed in Brazil since late 20th century, with decrease in natural food rich in fibers and micronutrients and increase in indus-

trialized food featuring high fat, salt and sugar rates. Low-waged populations have also changed to a food-intake profile associated with obesity, hypertension and diabetes. Collectors of recyclable matter, who earn their living collecting, selecting and selling paper, cardboards, glassware, iron and non-iron material, are included in this group. Current research verifies the food-intake profile in collectors of recyclable materials.

Methods: A cross-sectional and descriptive study, comprising demographic, anthropomorphic and food-intake data, was undertaken with 273 collectors of recyclable matter from 15 cooperatives in seven towns in southern Brazil. Regular intake of food, such as beans, fruits, vegetables, fried food, refreshments and sweets, full milk, meat fat and breakfast, was investigated. Data were analyzed by Excel and results described according to frequency.

Results: Sample comprised 92% adults, 73% females, 59% non-whites and 51% overweight. Food-intake profile of the above population comprised regular low consumption of fruit (84%) and vegetables (53%), high consumption of fat meat (64%), full milk (55%), lack of breakfast (62%), and a high intake of sweets (29%), fried food (24%) and soft drinks (19%), although 84% intake beans at least five days in the week.

Conclusions: Food intake of low-waged populations is similar to or worse than that of the Brazilian population as a whole. High intake of food rich in sugars and fats may be associated with high overweight, diabetes and hypertension rates in these populations as verified in other studies in Brazil. Policies to enhance the intake of healthier food and to discipline industrial food advertisements should be taken.

Key words: food-intake profile, obesity, nutritional transition, Brazil.

PO3104

PREDOMINANCE OF LOW STATURE AND ASSOCIATED FACTORS IN ECONOMICALLY AND SOCIALLY VULNERABLE POPULATIONS IN SOUTHERN BRAZIL

F. Auler[1,2], A. Nakashima[1], C. Rosaneli[1], W. Almeida[1], L. Salles[1], A. Fadoni[1], C. Veltrini[1], R. Cuman[2]

[1]Nutrition Couse, School of Health and Biosciences, Pontifical Catholic University of Parana, Brazil
[2]Post-Graduation Program in Health Sciences, State University of Maringá , Brazil

Background and objectives: Low stature is associated with nutrition deficiencies during the growth and development stages in childhood. It is actually a frequent condition in economically and socially vulnerable populations and, according to Barker´s theory, may trigger deleterious effects in adulthood. Adaptive mechanisms which make such people particularly susceptible to chronic diseases (obesity, hypertension, diabetes) are unleashed. Collectors of recyclable matter, who earn their living collecting, selecting and selling paper, cardboards, glassware, iron and non-iron material, are included in this group. Current research determines the predominance and association of low stature in collectors of recyclable materials.

Methods: A cross-section study, comprising demographic, anthropomorphic and biochemical data, has been undertaken with 273 collectors of recyclable matter from 15 cooperatives in seven towns in southern Brazil. Low stature was determined by lower rates than 5º percentile of WHO´s growth standard. Data were analyzed by SPSS and Pearson´s test at $p< 0.05$ was undertaken.

Results: Sample was largely composed of adults (92%), females (73%) and non-whites (59%), of which 17% were diabetics, 22% had a low stature, 25% were hypertensive, 51% were overweight and 66% featured cardiovascular risk (waist circumference : stature). Low stature was associated with age, schooling level, weight, cardiovascular risk, body fat, haemoglobin, total cholesterol, LDL-cholesterol, glycaemia and creatinine ($p<0.05$).

Conclusions: Frequency in low stature, overweight, diabetes and hypertension in the above-mentioned vulnerable population is similar to or higher than that in Brazilian population as a whole and is associated with numberless variables confirming Barker´s theory. Data show that low-waged populations live with deficit illnesses such as nutritional excesses, although without any availability to and attention from the public policies.

Key works: Cardiovascular risk, collectors of recyclable materials, food-intake profiles, low stature.

PO3105

PATTERNS OF ALCOHOL CONSUMPTION IN LIAONING, CHINA

S. Li[1], X. Li[1], H. Li[1], D. Luan[1], Z. Liu[1], X. Jin[1], Z. Li[1], X. Liu[1], T. Shi[1]

[1]Institute of Nutrition and Food Safety, Liaoning Center For Disease Control and Prevention, China

Background and objectives: To examine the patterns of alcohol drinking among adults in Liaoning province.

Methods: Data on 1,039 adults aged 18 years old and older from 480 households participated in the China Health and Nutrition Survey were used. A multistage stratified cluster random scheme was used to draw the sample in Liaoning. Alcohol consumption data were collected by using food frequency questionnaire and three consecutive 24-hour recalls.

Results: 34.0% of participants drank alcohol regularly (58.0% in men and 11.7% in woman). The average alcohol in-

take was 26.0±33.5 grams/day (g/d, weight of ethanol) among drinkers (29.1±35.1 g/d in men and 11.7±19.7 g/d in women). Heavy drinkers were those aged 45-59 years (62.5%, 33.8±35.9 g/d), living in rural areas (59.9%, 34.8±38.5 g/d), and with lower education (50.6%, 37.3±38.1 g/d) among men, and those aged 18 - 44 years (16.1%, 15.8±27.6 g/d), and with higher education (25.6%, 6.0±6.4 g/d) among women. 35.9% of male drinkers drank daily and the favorite types were liquor (72.3%) and beer (63.0%). 30.2% female drinkers drank 1-3 times a month and the favorite types were beer (66.7%) and wine (31.7%). Excessive, dangerous, and harmful drinking were 13.8%, 11.1%, and 11.1% among male drinks and 9.5%, 9.5%, and 4.8% among female drinkers, respectively. Dangerous and harmful drinking were higher in rural (40.4%) than in urban (20.0%) areas and higher in low education (43.2%) than in high education (25.6%) groups.

Conclusions: Alcohol consumption is high and varies significantly among gender, education level and living areas in Liaoning, China.

Key words: nutrition survey, alcohol consumption.

PO3106

MULTI-SECTOR LINKAGE MODELS FOR COMMUNITY-BASED NUTRITION IN ETHIOPIA-MODEL 1: MARKET APPROACH OF LOCAL COMPLEMENTARY FOOD PRODUCTION

M. Nakamori[1], T. Desta[2], N. Takashi[1], A. Tokunaga[1], Z. Habtamu[2], S. Deba[2]

[1]Japan Intrenational Cooperation Agency, Addis Ababa, Ethiopia
[2]Oromia Regional Health Bureau, Addis Ababa, Ethiopia

Background and objectives: In order to achieve the Millennium Development Goal 4: Reduce Child Mortality in Ethiopia, it is a major stumbling block that almost a half of Ethiopian children under five years old are stunted and more than 10% wasted. The JICA project, designed to be gender-sensitive and multi-sectoral, implements activities including production of complementary food (CF) (Model 1) and growing vegetable gardens (Model 2) by women's group, aiming to develop effective models for nutrition improvement through multi-sectoral coordination in Oromia region, Ethiopia.

Methods: Model 1 adopts a market approach where issues of access and utilization are addressed by promoting consumption of nutrition-rich locally processed CFs. In this regards, a women's group was established to generate income from the production and sales of CFs at a shop. The income generating activity is linked to BCC, particularly cooking demonstrations of CF for mothers with under two children. The nutrition value was enriched by roasting/germinating grains/legumes in the locally processed CFs.

Results: After 6 month of the implementation, CF sales by the women's group increased 50% from the initial period and 30% of the total population of under two children covered by cooking demonstrations.

Conclusions: We need further determinations for the impact of the model in mother's behavioral change of CF preparation as well as nutrition status of the children.

Key words: malnutrition, complementary food, local food production, multi-sector linkage, community-based nutrition.

PO3107

MULTI-SECTOR LINKAGE MODELS FOR COMMUNITY-BASED NUTRITION IN ETHIOPIA -MODEL 2: A FOOD AVAILABILITY MODEL

M. Nakamori[1], T. Desta[2], N. Takashi[1], A. Tokunaga[1], Z. Habtamu[2], S. Deba[2]

[1]Japan Intrenational Cooperation Agency, Addis Ababa, Ethiopia
[2]Oromia Regional Health Bureau, Addis Ababa, Ethiopia

Background and objectives: In order to achieve the Millennium Development Goal 4: Reduce Child Mortality in Ethiopia, it is a major stumbling block that almost a half of Ethiopian children under five years old are stunted and more than 10% wasted. The JICA project, designed to be gender-sensitive and multi-sectoral, implements activities including production of complementary food (CF) (Model 1) and growing vegetable gardens (Model 2) by women's group, aiming to develop effective models for nutrition improvement through multi-sectoral coordination in Oromia region, Ethiopia.

Methods: Model 2 adopts a food availability model where issues of availability of and access are addressed by development and promotion of nutrition-rich food. A rapid assessment on food availability was conducted in November 2011 to assess local production patterns of crops for household consumption and market as well as available resources that could be tapped for production of missing ingredients. Based on the information from the assessment, a community action planning was organized with participation of community cabinet members and the two key activities agreed were: cooking demonstration of complementary foods using the recipes developed; and production of missing food items in the diet though households that have private rainwater harvesting ponds as an entry point.

Results: After 3 month of the implementation on these key activities, 70 % of total population under 2 children covered by cooking demonstration and dietary diversity in target households was increased.

Conclusions: A further monitoring of the model activities is needed to consider impacts of the model at community level.

Key words: malnutrition, food availability, local food production, multi-sector linkage, community-based nutrition.

PO3108

NUTRITIONAL STATUS OF ALGERIAN CHILDREN AGED 6 TO 12 YEARS

L. Bechiri[1], A. Agli[1]

[1]Laboratory of Nutrition and Food Technology (LNTA) , Skikda, Algerie

Background and objectives: Currently, nutrition education is difficult to apply because the power of the child depends not only the family but also in society. Our work aims to compare observed between diet and advised Algerian children 6 to 12 years to correct some errors foods.

Methods: Our study is a qualitative description of the food situation in 2196 Algerian children aged 6 to 12 years using a qualitative data analysis, 7 studies only 67 studies that talk about the food situation of Algerian children 6 to 12 years. Then a comparison between the observed and the power supply recommended (2001).

Results: The decrease in daily energy intake of children in relation to recommended intakes. Energy shares breakfast and lunch are lower. An imbalanced distribution of macro and micronutrients. Breakfast is neglected, the composition of the morning snack and snack foods with high energy density, snacking is common among children all the time watching television. Food snack foods are the kind Junk Food. A decrease in the practice of regular physical activity.

Conclusions: It seems that the eating habits of Algerian children are not different from those of industrialized countries; they reproduce the same mistakes food, it is urgent to develop appropriate prevention and implementing awareness programs especially in institutions school.

Key words: Algeria, situation food, nutrition education, healthy children 6 to 12 years, recommended nutritional intakes 2001.

PO3109

DEVELOPMENT AND VALIDATION OF FOOD-FREQUENCY QUESTIONNAIRES IN IRAN - A REVIEW

S. Edalati[1]

[1]Faculty of Health & Nutrition, Tabriz University of medical science , Iran

Background and objectives: The food-frequency questionnaire (FFQ) has been widely used in large-scale nutritional epidemiological studies. Due to great differences in food habits, FFQs must be tailored for use with specific populations. The aim of this review is to review FFQs developed and validated in Iran.

Methods: A literature search was undertaken to trace articles reporting on development of FFQs for Iranian populations.

Results: Some FFQ validation studies include the following: A semi-quantitative FFQ developed for Tehran lipid and glucose study that was found to be reliable and valid for assessing the intake of several food groups, nutrients, and dietary patterns derived from it. A short FFQ for screening women of childbearing age for vitamin A status in northwestern Iran developed too. There are also studies about development of FFQs to assess fruit and vegetable intake in adults and a FFQ for calcium intake in 9-13 years old children in the city of Tehran. Furthermore, a study was done to evaluate validity and reproducibility of energy and nutrient data derived from a FFQ design for a prospective study on diet and esophageal cancer in Northern Iran.

Conclusions: There is a research gap in developing FFQs for different study goals and target populations in Iran. Further more studies are needed to develop FFQs especially short FFQs for different purposes among Iranian individuals.

Key words: Foor-frequency questionnaire, nutritional epidemiological studies, validation.

PO3110

FOOD INSECURITY AND METABOLIC SYNDROME AMONG WOMEN FROM LOW INCOME COMMUNITIES IN MALAYSIA

Z. Mohd Shariff[1], N. Sulaiman[1], R. Jalil[2], C Y. Wong[1], H Y. Yong[1], M N. Mohd Taib[1], G L. Khor[3]

[1]Universiti Putra Malaysia, Serdang, Selangor Malaysia

[2]Universiti Sains Malaysia, Kubang Krian, Kelantan Malaysia

[3]International Medical University, Kuala Lumpur Malaysia

Background and objectives: Previous studies have shown that food insecurity is associated with risk of chronic diseases. There is no published information on the relationship between food insecurity and metabolic syndrome in Malaysia. This cross-sectional study examined the relationship between household food insecurity with Metabolic Syndrome (MetS) and its individual risk factors among women (n=625) in low income communities.

Methods: The Radimer/Cornell Hunger and Food Insecurity instrument was utilized to assess food insecurity. Diet diversity, anthropometry (waist circumference and body mass

index), blood pressure and fasting venous blood for serum lipid and plasma glucose were also obtained. MetS was defined as having at least 3 risk factors and according to the Harmonized criteria.

Results: The prevalence of food insecurity in this sample was 78.4% (26.7% household food insecure, 25.3% individual food insecure, 26.4% child hunger). The percentage of women with abdominal obesity, hypertension, low HDL-C, high TG, high FPG and MetS was 39.7%, 32.8%, 59.0%, 14.1%, 33.0% and 25.6%, respectively. Women in food insecure households, particularly those reporting individual food insecure and child hunger, were more likely to have reduced number of metabolic risk factors ($p<0.05$) and lower risk of abdominal obesity ($p<0.01$), elevated total cholesterol ($p<0.05$) and LDL-cholesterol ($p<0.05$) compared to food secure women. The risk however, increased as food insecurity improves.

Conclusions: Efforts to improve food insecurity among low income households should address availability and accessibility of healthy food choices that could reduce the risk of metabolic syndrome and chronic diseases.

Key words: food insecurity, metabolic syndrome, low income communities.

PO3111

WORLDWIDE CONSUMPTION OF EDIBLE INSECTS OF ORTHOPTERA ORDER

V. Melo[1], C. Calvo[2], T. Quirino[1], S. Murata[1], S. Macin[1]

[1]Universidad Autónoma Metropolitana-X, México, D.F., México

[2]Instituto Nacional de Ciencias Médicas y Nutrición Salvador Zubirán, México, D.F., México

Background and objectives: Entomophagy term generally used to refer human consumption of insects is common in cultures of many ethnic groups since ancient times in different parts of the world, such as Latin America, Africa, Asia, India, Australia and New Zealand. Over 1,000 insects are known to be eaten in 80% of the World nations. However, in some societies mainly in Europe, insect eating is uncommon, today insect eating is rare in the developed world, but insects remain a popular food for many developing regions worldwide. Some of the more popular insects eaten either raw or prepare with other staples around the world include crickets, cicadas and grasshoppers. The aim of this study was to investigate which countries consume insects from the Orthoptera order and to analyze the macronutrients of them.

Methods: Insects were collected in Mexico, obtained in local markets of Thailand, China, India, Japan, South Africa, Kenya, Australia and New Zealand and macronutrient analyzed by AOAC methods.

Results: Data obtained show that insects provide a good source of macronutrients, however contain of each parameter vary according the environment conditions among other factors. They are available at any ecology system, reproduce at a faster rate, generally have high protein conversion efficiency and do not compete for water.

Conclusions: Orthoptera order insects, represent a good source of nutrients, their consumption should be promoted to include them in a daily diet to improve nutrition of malnourish people of developing countries.

Key words: edible insects, entomophagy, Orthoptera order.

PO3112

NUTS CONSUMPTION AND FREQUENCY IN PHYSICIANS AND NURSES

M. Khatibi[1], M. Sanjari[2], M. Shokouhi[3]

[1]Deputy of Treatment,Keramn University of Medical Sciences , Iran

[2]Physiology research center, Kerman University of medical sciences, Kerman, Iran

[3]Research center for modeling in health, Kerman University of medical sciences, Kerman, Iran

Background and Objectives: Epidemiological studies have consistently demonstrated that frequent nuts consumption is associated with reduced risk of developing coronary heart diseases, type 2 diabetes, or death by overall mortality causes .Nuts are fatty foods and presumably for this, until recently, were ignored or treated with a great deal of caution on most dietary recommendation .The aim of this study is survey nuts consumption in physicians and nurses that work in education hospital in Kerman.

Methods: A cross sectional study was done in 2011-2012. Three hundred nurses and 200 physicians were included .The study has done by a questionare that involved demographic information and questions about eating and frequency behaviors. All statistical analysis was performed by SPSS and P value less than 0.05 was considered as statistically significant. **Results:** Population of this study was 300 nurses and 200 physicians. Four hundred forty one of them completed the questionnaire .Mean of age was 34.45±8.3. Mean of BMI was 23.94±4.17. Less than 10% of population consumed nuts habitually and 18.8% of them never ate it. The majority of the population eat them weekly.

Conclusions: Despite of nuts importance, their consumption is low among this population. Educational programs needed for developing of their knowledge and their usefulness of consumption.

Key words: consumption behavior, frequency behavior, nut, nurses, physician.

PO3113

FROM SOUL FOOD TO FAST FOOD: THE MODERN AFRICAN-AMERICAN DIET

V. Oates[1], R. Fleming[1], A. Franklin[1]

[1]Tennessee State University, Nashville, USA

Background and objectives: African-Americans statistically have higher rates of obesity and nutrition-related illnesses, due to unhealthy diet and sedentary lifestyles. This study characterizes the evolving diet of modern African-American people which has shifted from agrarian based to more processed foods, contributing to their current health condition.

Methods: Five 2-hour focus groups were held with African-Americans living in Davidson County, TN for a project aimed to promote weight management among African-American children. One focus group consisted of community members, two with parents/guardians, and two with children deemed at risk for adulthood obesity. A series of questions about dietary habits and media influence on diet were discussed within a cultural context.

Results: (1) Modern soul food and/or 'black food" consists of food that is cost-efficient and energy dense but not home cooked; (2) Economic disparities limit access to fresh, healthy food options; (3) Time constraints inhibit the planning and preparing of healthy home-cooked meals; and (4) Media targets African-American consumers with the least nutritious and nutrient-dense products.

Conclusions: Focus group participants identified a number of fast food chains and manufactured foods as 'black food' and consumption of these high caloric, low-nutrient dense foods occur frequently. While older focus group participants reflected how the traditional African-American diet used to include fresh produce , younger participants commented that economics and accessibility prevented them from incorporating produce in their diets. Media and advertising were identified as a contributing influence on diet by all age groups.

Key words: African-American, fast food, soul food.

PO3114

FACTORS THAT INFLUENCE EDIBLE WILD FRUIT CONSUMPTION AND CONSUMPTION HABITS: A CASE OF GULU DISTRICT, UGANDA

O. Christine[1], O O. Hannington[2], N. Roos[3]

[1]Gulu University, Gulu, Uganda
[2]Makerere University, Кампала, Uganda
[3]University of Copenhagen, Copenhague, Denmark

Background and objectives: Rural communities in many parts of this district benefit in many ways from consuming wild edible fruits. However, compelling factors and daily consumptions habits of these fruits are not documented. The objectives of the study were therefore to document the main daily community's consumption habits of these fruits, to document compelling factors for consuming these fruits and to establish community's daily practices towards these wild fruits. This study was conducted in Awach, Paicho, Patiko, Ongako, Lalogi and Bobi Sub-Counties, and 350 respondents were interviewed.

Methods: Data were collected using semi-structured questionnaires during interviews with respondents. The edible fruit trees under study were obtained from our previous study and included Vitex doniana Sweet, Vitelleria paradoxa Gaertn, Borassus aethiopum Mart., Tamarindus indica L. and Anonna senegalensis Oliv.

Results: The result showed that consumptions of these fruits were highly influenced by sensory responses (55%), social factors (13%), availability and accessibility (16%), and hunger. These factors significantly varied among the fruit species ($P<0.05$). Children (52.3%), pregnant women (23.7%) and the sick (19.1%) were more encouraged to consume these fruits, intentionally to derive satisfaction and pleasure from them. Gender inclusion in fruit harvest insignificantly varied ($P>0.05$). Correlation analysis was positive for both preferred fruits and frequency of consumption ($r=0.2942$), and preferred time for consumption ($r=0.0635$). Children younger than 15 years were found to be very active consumers. Very few individuals showed interest in including fruits as part of their daily meals.

Conclusions: Many factors influenced the consumption fruits, but varied among fruit species. Besides, inadequate knowledge existed on nutritional and health benefits associated with eating these fruits.

Key words: wild fruits, consumption habits, Gulu.

PO3115

CATALYZING HOUSEHOLD SUPPORT FOR IMPROVED MATERNAL CARE: A RANDOMIZED CONTROL TRIAL OF NEW METHODS FROM BANGLADESH

S. Sinharoy[1], F. Ameen[1], J. Waid[1]

[1]Helen Keller International, Dhaka, Bangladesh

Background and objectives: In Bangladesh, recent research has found higher rates of undernutrition among pregnant women compared to non-pregnant women. Additionally, over 50% of babies are born with low birth weight. Cultural practices around food and care likely increase the risk of undernutrition among pregnant women and infants. HKI identified a need for behavior change communication (BCC) materials targeting households, particularly husbands and mothers-in-law, with the objective of improving knowledge and practices around nutrition of pregnant women.

Methods: BCC materials were developed following formative research, which identified facilitators and barriers to behavioral objectives as well as key words and phrases for use in the materials. It also examined households' usage, comprehension and preferences regarding communication materials. The effectiveness of these interventions is currently being tested in a randomized control trial (RCT).

Results: Following multiple rounds of field testing, two BCC materials were finalized. One is a game with dice and cards depicting positive and negative behaviors related to maternal and child health and nutrition (MCHN). The second is a calendar that spans from the fourth month of pregnancy through six months post-partum, with monthly messages and actions to promote household support of MCHN. The immediate goals of these materials is an increase in male knowledge of best care practices for pregnant women and infants, as well as increased support for mothers in terms of childcare and other household tasks. In the long run, the materials are expected to have an impact on child nutritional status.

Conclusions: Based on evaluation results, these materials may provide a scalable option to reach households with messages to improve cultural practices around food and care for pregnant women.

Key words: behavior change communication, pregnant women.

PO3116

BUILDING COMMUNITIES OF CARE: GENDER EQUITY AS THE HEART OF FOOD SECURITY

R. Ridolfi[1], S. Afroz[1], E. Kethran[1], R. Afroj[1], E. Hillenbrand[2], A. von Kotze[3]

[1]Helen Keller International, Dhaka, Bangladesh
[2]Helen Keller International, Asia-Pacific Regional Office, Phnom Penh, Cambodia
[3]University of Western Cape, Cape Town, South Africa

Background and objectives: Gender discrimination is a structural cause of the alarmingly high rates of food insecurity and malnutrition in Bangladesh. Formative research undertaken at the start of many of Helen Keller International's (HKI) projects has indicated that the low status of mothers within households is a significant obstacle to the adoption of nutrition practices such as exclusive breastfeeding or taking extra food and rest during pregnancy. HKI sought to design a new training curriculum to challenge existing gender norms and support young women's autonomy in order to break the intergenerational cycle of malnutrition.

Methods: The curriculum is based on activities from "Stepping Stones" and previously developed HKI's behavior-change communication modules, and builds on existing knowledge and local practices. The curriculum strongly emphasizes action at the personal, inter-personal, family and community levels while building skills in communication, assertiveness and problem-solving.

Results: Following pilot-testing in rural communities in the north of Bangladesh, the adaptation of this curriculum, called "Building Communities of Care", has been finalized, including the development of a facilitators' manual in both Bangla and English, and guidelines on the adaptation of the curriculum contents, facilitation skills, and a qualitative assessment. The curriculum gives family stakeholders (women, husbands, mothers-in-law, and fathers-in-law) the opportunity to discuss nutrition and gender-related issues among their communities and improve or change nutrition and food security practices. This intervention is currently being tested using a cluster randomized design.

Conclusions: The structure of the training has been well-received by both field workers and families in two rural areas. The evaluation results will help to target this intervention for further dissemination in other programs seeking to improve the food security and nutrition of individuals and improve gender relations.

Key words: nutrition practices, food security, behavior-change communication.

PO3117

COMPARING THE QUALITY OF EATING OUT AND EATING AT HOME IN BRAZIL

R. Hoffmann[1]

[1]ESALQ, University of São Paulo, Piracicaba, Brazil

Background and objectives: Some papers suggest that out-of-home eating in Brazil is less healthy than food consumed at home, linking the former to junk food. Our objective is to show that such view is mistaken.

Methods: We use data from the Brazilian Nationwide Dietary Survey conducted along with the 2008-2009 Household Budget Survey (POF 2008-2009). Usually the comparison is between those who eventually eat out (40.2%) and those who eat only at home (59.8%). This means comparing very different groups of people. Those who eventually eat out on average have a higher family income per capita (45% higher), schooling (8.8 years as compared to 6.4) and higher daily calories consumption (2,063 kcal versus 1,801). In order to estimate the impact of 'eating out' on diet quality it is necessary to control for the effects of other factors, in particular income levels. Unobserved variables such as gluttony might also have an impact. Using the information about people eating out or at home (sample of 12,045 persons in POF 2008-2009) we estimate the impact of 'out-of-home eating' controlling for all the individual characteristics, even gluttony. An appropriate estimate is obtained by considering, for each individual, the difference in the value of the dependent variable between eating outside home and eating at home.

Results: We show that, for each 100 kcal of food consumed away from home fat and salt content is lower, and fruit and C vitamin content is higher. On the other hand, food outside home presents lower A vitamin and iron content and more sugar. It is also shown that away-from-home eating is associated with a lower probability of an adult presenting overweight or obesity.

Conclusions: On average, eating out-of-home may be healthier than eating at home.

Key words: away-from-home eating, obesity, overweight, Brazil.

PO3118

FOOD CONSUMPTION CHARACTERISTICS AMONG SOUTH BRAZILIAN LOW-INCOME YOUTH

C. Rosaneli[1]*, L. Trentini*[2]*, A. Cardoso*[2]*, S. Spinelli*[2]*, S. Silva*[1]*, F. Auler*[3]

[1]School of Health and Biosciences, Pontificia Universidade Catolica do Parana, Curitiba, Parana, Brazil

[2]Technical Course in Nutrition and Dietetics, TECPUC, Curitiba, Parana, Brazil

[3]School of Health and Biosciences, Pontificia Universidade Catolica do Parana, Maringa, Parana, Brazil

Background and objectives: Diet quality, family size, socioeconomic variables and home area can interfere in Brazilian consumption. The Young Apprentice Program is intended for qualification and professional knowledge to Brazilian low-income youth. Analyze food consumption characteristics among south Brazilian low-income youth.

Methods: Cross-sectional descriptive study with 73 youth, among 14 and 24 years old, from TECPUC Young Apprentice Professional Qualification Program. The questionnaires were self-applied during health classes as alternative evaluation. Each question was explained by the nutritionist teacher. The data were analyzed in Excel software and the results were described thought frequency.

Results: All research participants live in a high social vulnerability area in Curitiba, Paraná, and therefore are inserted in this Program. Almost two thirds of the sample live in small houses with more than four people together. The present study main finds were that 54.8% have their meals watching TV, talking on the cell phone, in front of the computer or doing their job; 61.6% uses to eat sweets every day; 66% declare having 4 or more meals per day and 47.8% refer to delay their meals in more than 4 hours; 32% drink more than 5 glasses of water/day; 60% overeat pizza and over drink soda on the weekends; 78.1% mention never have done diet to lose weight, but are not satisfied with their body.

Conclusions: Health Education may be an important tool in health risk factors prevention associated to better food choices, assuring nourishing and nutritional safety to this population.

Key words: food consumption, nutrition transition, Brazil, low-income.

PO3119

FARM FAMILY DECISIONS IN BANGLADESH: WHAT MOTIVATES MEN'S SPENDING TO IMPROVE NUTRITION FOR WOMEN AND CHILDREN

T. Schaetzel[1], M. Antal[1], M. Griffiths[1]

[1]The Manoff Group , Washington, USA

Background and objectives: Gains in agricultural production and income often translate poorly into nutritional gains for women and children. Use of agriculture-derived income to purchase specific nutritious foods likely would improve the nutritional impact of this income. Nutrition education concerning the nutritional needs of women and children, and the nutrient value of various food items, may help consumers make more nutrition-positive purchases, but successful promotion of such purchases requires understanding which food and nonfood items normally are purchased when agriculture income increases, and why individuals choose these items. The objective of this investigation is to understand the motivations of Bangladeshi farmers when making specific food purchases, and the purpose is the development of promotional approaches to motivate the purchase of nutritional foods for women and children.

Methods: Male farmers from Barisal and Khulna, Bangladesh, participated in focus group discussions (FGD) concerning attitudes about items available in local markets. Only male farmers participated because Bangladeshi men generally conduct all household marketing. Using pile sort techniques, participants categorized pictures of food and nonfood items according to "the way people see" each item. Categories represented economic concerns (e.g., things purchased at every market visit), health (e.g., good for women and/or children's health), and social values (e.g., things a responsible husband provides, luxury items). Following the FGD, 24 FGD participants provided in-depth interviews detailing their personal attitudes toward the items and categories.

Results: The results of the FGD and interviews provided the basis for promotional messages provided to agricultural extension agents, farmer field group leaders, and national agriculture information services.

Conclusions: As agricultural production and income increase, households consider a variety of factors when deciding how to use the income they gain, and these factors must be satisfied for households to make pro-nutrition market purchases.

Key words: agriculture and nutrition, food choice, income elasticity.

PO3120

CHANGES IN CAPILLARY DIAMETER, DENSITY AND RBC VELOCITY OF NAIL-FOLD MICROCIRCULATION IN HEALTHY PEOPLE INDUCED BY WARM/HOT AND COOL/COLD FOODS

D P. Chao[1], C L. Hsieh[2,3], L Y. Sheen[4,5,6]

[1]Department of Tourism and Leisure Management, China University of Technology, Hsinchu, Taiwan
[2]Graduate Institute of Integrated Medicine, China Medical University, Taichung, Taiwan
[3]Department of Chinese Medicine, China Medical University Hospital, Taichung, Taiwan
[4]Graduate Institute of Food Science and Technology, National Taiwan University, Taipei, Taiwan
[5]National Center for Food Safety Education and Research, National Taiwan University, Taipei, Taiwan
[6]Center for Food and Biomolecules, National Taiwan University, Taipei, Taiwan

Background and objectives: In the traditional Chinese medicine, both personal constitution and food attribute are divided into two major categories, i.e. warm/hot and cool/cold. However, there are less scientific evidences about the connection between food attributes and personal constitutions. In our previous study, we suggested that the capillary RBC velocity of nail fold microcirculation (NFM) may be a promising way available to classify food attributes. The aim of this study was to confirm the relationship between the different attributes of food and the capillary signals of NFM produced in the healthy people with different constitutions.

Methods: Fifty subjects constitutions were diagnosed by two Chinese medical doctors. Watermelon and cantaloupe were selected to be the cool/cold samples, as well as fried peanut and seedless dried longan were chose to be the warm/hot samples. Capillary signals and subjective feelings were then measured with a laser Doppler anemometer and a self-edited questionnaire.

Results: The capillary density, diameter and RBC velocity of all subjects would be significantly increased by the warm/hot samples and decreased by the cool/cold ones. However, the capillary density and RBC velocity of the hot constitution subjects (n=29) after taking longan was raised more significantly compared with taking peanut, but no differences between taking watermelon and cantaloupe. We considered that the hot constitution people would be more sensitive to warm/hot foods than cool/cold foods. On the contrary, the cold constitution subjects (n=21) would be more sensitive to cool/cold foods based on the results of their capillary signals after taking cantaloupe was reduced more significantly compared with taking watermelon.

Conclusions: Accordingly, the capillary signals of NFM should be a suitable methodology to scientifically classify the different degree of food attributes in accordance with the different constitutions of people.

Key words: traditional Chinese medicine, food attribute, personal constitution, capillary RBC velocity.

PO3121

FOOD FREQUENCY DATA OF A SELECTED SRI LANKAN POPULATION

M F F. Nusha[1], K. A[1], K N W. Walatara[1], U P K. Hettiaratchi[1], L V. Athithan[1], P P R. Perera[1]

[1]Department of Biochemistry, Faculty of Medical Sciences, University of Sri Jayewardenepura, Sri Lanka

Background and objectives: There is an epidemic of obesity and type 2 diabetes currently in the world. Main reasons for these health issues are life style changes, lack of physical exercise and diet. Thus, the aim of this study was to analyze the food frequencies of a selected non-diabetic population in Sri Lanka.

Methods: 46 non-diabetics (males-8; females-36) with normal fasting blood sugar levels (<110 mg/dl) were recruited. The study design was descriptive cross section. An interviewer administered questionnaire was used to collect data. Ethical approval was from Ethics committee, Faculty of Medical Sciences, University of Sri Jayewardenepura.

Results: White & red rice consumption (>once/day) were 70% and 35% respectively. However, 80% & 91% of the population respectively had never consumed parboiled rice or brown bread. 13% consumed starchy vegetables and 61% green leafy vegetables daily. 73% had never consumed pulses as a main dish. Daily fruit consumption (>once/day) was 48%. Participants consumed fish (24%) and egg (17%) daily. 13% consumed processed meat once/week. 8% consumed red meat/week and 78% consumed white meat with or without skin. 74% consumed biscuits and cookies as a snack once/week and 54% took snacks daily. Daily usage of oil was 65% with 61% using coconut oil as the main cooking oil. The reuse of oil for cooking purposes among the population was 44% and fried food consumption >2/week was 47%. 78% of participants used full cream milk/powder when drinking tea. Non-fat yoghurt and cheese consumption were 30% and 39% respectively. 24% of the population didn't use butter or margarine.

Conclusions: Parboiled rice, fruits, fish, pulses and non-fat dairy product consumption of the population was lower compared to the usage of oil and other fatty foods in this population.

Key words: food frequencies, food intake, food consumption.

PO3122

INDIVIDUAL AND ENVIRONMENTAL RISK FACTORS FOR ADOLESCENTS' EATING BEHAVIOUR: A STRUCTURAL EQUATION MODELLING ANALYSIS

R. Verstraeten[1,2], Z. Pieniak[3], J. Leroy[4], M. Holdsworth[5], L. Maes[6], P. Kolsteren[1,2]

[1]Department of Food Safety and Food Quality, Ghent University, Ghent, Belgium
[2]Nutrition and Child Health Unit, Institute of Tropical Medicine, Antwerp, Belgium
[3]Department of Agricultural Economics, Ghent University, Ghent, Belgium
[4]Poverty, Health, and Nutrition Division, International Food Policy Research Institute (IFPRI), Washington DC, USA
[5]Public Health Section, The University of Sheffield, Sheffield, UK
[6]Department of Public Health, Ghent University, Ghent, Belgium

Background and objectives: Health promotion interventions targeting dietary habits are a potentially effective way to tackle obesity in low- and middle-income countries. To tailor such interventions to the needs/context of these countries, a detailed understanding of culture-specific factors influencing adolescents' dietary behaviour is essential. A previous study in Ecuadorian adolescents proposed an explanatory model for culture-specific individual and environmental factors influencing adolescents' dietary behaviour. We examined the direct and indirect effects of these factors for adolescents' fruit and vegetable (F&V) and sugary drinks intake.

Methods: We conducted a cross-sectional study in 770 school-going Ecuadorian adolescents in urban and rural Southern Ecuador. Data were collected on factors, dietary behaviour, socio-economic status and anthropometry. Direct and indirect effects of individual (attitudinal beliefs, self-efficacy, habit strength and food safety) and environmental (availability, accessibility, parenting and school practices) factors on F&V and sugary drinks intake were modelled using structural equation modeling. Moderating effects of socio-economic status, financial autonomy and setting were simultaneously examined.

Results: The hypothesized model performed well, indicating acceptable goodness-of-fit for both the measurement and structural model. Within the model, parental permissiveness had a direct positive effect on sugary drink intake. A direct link was found between the attitudinal belief that adolescents have a better body image when they eat healthily, and eating more F&V. At the same time, body image positively mediated the relationship between school support and adolescents' F&V intake. For both F&V and sugary drink intake, parental permissiveness was associated with self-efficacy, barriers to eating healthily and habit strength; and accessibility was associated with food safety and barriers to eating healthily.

Conclusions: Both parents and school play an important role in adolescents' dietary behaviour. These findings highlight potential points of leverage for developing future interventions in an Ecuadorian adolescent population.

Key words: structural equation modelling, Ecuador, healthy eating, adolescents.

PO3123

DEVELOPMENT OF A RECIPE BOOK FOR SRI LANKANS' TRADITIONAL FOODS AND DISHES

A M N T. Adikari[1], P G T T. Lakmali[1]

[1]Wayamba University of Sri Lanka

Background and objectives: Sri Lankan foods are unique like its culture. The specialty of our food is that the same food is prepared differently in different regions of the country. In Sri Lanka, though there are many published recipe books, the nutritional composition of foods being prepared by following these recipes is not available. Thus this study was carried out to develop a recipe book including nutrition composition of Sri Lankans' traditional foods and dishes.

Methods: Different food recipes for traditional foods and dishes were collected from adult women in different areas (08) from different districts by home visits, face to face interviews, through telephone calls and reviewing the recipes from recipe books and from the internet. Two women were interviewed to develop one recipe and average was taken for development of the recipe book. Solid and liquid ingredients were measured by home scale and measuring cylinder respectively and by household measures for both solid and liquid foods. The recipes which were taken from telephone calls were prepared in the laboratory and got the measurements. Nutrition composition of recipes was analyzed using Food Base 2000 software and Food composition tables of India and Asia. When analyzing the recipes by database, weight changes during cooking were considered according to the food varieties.

Results: The developed recipe book contains around 50 Sri Lankan traditional foods recipes, the method of preparation as well as the nutritional composition. The recipes in the book are presented under five food categories, ie. cereal based foods, sweets, dishes, mallum and kola kenda / herbal drinks.

Conclusions: Developed recipe book, including nutrition composition of Sri Lankans' traditional foods and dishes can be used as an educational tool for menu planning for normal people as well as patients needing dietary planning.

Key words: recipe book, traditional food, nutritional composition.

PO3124

NUTRITIONAL STATUS, UNHEALTHY EATING HABITS AND PHYSICAL ACTIVITY IN THAI WOMEN

P. Tapanee[1], P. Apiraknapanon[2]

[1]Institute of Nutrition, Mahidol University, Nakornpathom, Thailand

[2]School of Nursing, Shinawatra University, Pathun Thani, Thailand

Background and objectives: Over the past three decades the prevalence of non-communicable diseases (NCDs) in Thailand has increased rapidly. Obesity, unhealthy eating habit and unphysical activity are strongly associated with the development of NCDs. The aim of this study was to investigate the nutritional status, unhealthy eating habits and physical activity in Thai women.

Methods: Nutritional status was assessed by BMI and waist circumference. Unhealthy eating habits and physical activity data were collected by using questionnaire, 4426 Thai women were enrolled.

Results: The Nutritional status revealed that 37.9% of the subjects were 37.9% obese (BMI > 25.0 kg/m^2) and 47.9% had abdominal obesity. There were 30.5 % of the participants have unhealthy eating habits; 46.5% have a very inactive lifestyle. **Conclusions:** This study showed that one third of subjects were obese and also have inappropriate eating habits. Reducing improper diet habits and promotion of physical activity may help preventing NCDs.

Key words: nutritional status, eating habit, physical activity, Thai women.

PO3125

NUTRITION TRANSITION IN LOW-INCOME BRAZILIAN POPULATION

A. Magalhães[1], G. Dal Magro[2], R. Correia[3], J. Silveira[4],

[1]Universidade Federal da Grande Dourados, Dourados, Brazil

[2]Universidade Federal do Rio Grande do Sul, Porto Alegre, Brazil

[3]Faculdade Unida da Paraíba, João Pessoa, Brazil

[4]Universidade Vila Velha, Vila Velha, Brazil

Background and objectives: The nutrition transition is a worldwide phenomenon characterized by an increase of obesity and chronic non-communicable diseases (diabetes, hypertension and dyslipidemia) as a result of excessive consumption of foods with high energy density and high in sodium, combined with a sedentary lifestyle. This phenomenon was restricted

to populations of middle and upper income; however, it has also been seen in low-income populations. This study aimed to verify nutrition transition in low-income populations in Brazil.

Methods: The methodology used data from the system of records of the Health Ministry, which analyzed the prevalence recorded in the last 5 years (2008-2012). The categories were children 0-5 years old, 5-10 years old and teens 10-18 years old.

Results: The results showed that, considering the population in the last five years, the number of individuals underweight did not change for children from 0 to 5 years old, increased by 0.2% among children from 5 to 10 years old and reduced 2.1% among teenagers. Moreover, the number of overweight individuals has increased by 0.7% among children from 0 to 5 years old, 2.6% among children from 5 to 10 years old, and 3.1% among teens from 10 to 18 years old.

Conclusions: Based on the results, we can see that the nutrition transition has already manifested itself in low-income populations in Brazil, both in children and adolescents, once found to increase rates of greater weight than the rates of reduction of malnutrition. Considering that this population is beneficiary of Social Programs to Transfer Income, it is suggested that this activity should be complemented by other actions, as nutritional education for healthy consumption, for example.

Key words: nutrition transition, low-income populations.

PO3126

WHY SUSTAINABLE AND 'NUTRITIONALLY CORRECT' FOODS ARE NOT ON THE TABLE: WESTERN SYDNEY AND THE MORAL ARTS OF EVERYDAY LIFE

J. Dixon[1], B. Isaacs[2]

[1]NCEPH, Australian National University, Canberra, Australia
[2]School of Anthropology, Harvard University, Room 30, William James Hall, Cambridge, USA

Background and objectives: Within a context of future food security, the public health principle make healthy choices easy choices has become make healthy and sustainable choices easy choices. Dietary guidelines are being reframed, corporations are replacing unsustainable products, and consumers are being encouraged to become ecological citizens. While there is a growing literature on the sustainability practices of 'alternative' consumers, the food provisioning approaches of 'mainstream' consumers are less well understood.

Methods: This study is based upon in-depth interviews, photo essays and participant observation undertaken in a socio-economically disadvantaged area of Sydney, Australia, which aimed to uncover consumer views towards local, sustainable and healthy diets.

Results: Study participants were found to value cheap and tasty food over local or sustainably grown food; and while they associate nutritious food with fresh food, they will buy processed foods which can be less expensive, appeal to children and are subsequently less prone to waste. Reflecting mainstream Australian political culture, participants were pursuing a socially acceptable standard of living (including high mortgages, car reliance) which compromised household food budgets. They were also incorporating the pleasure and desires of family members as part of 'the moral arts of everyday life'.

Conclusions: Using social theories of consumption and practice sociology we argue that food choices and practices easy or not need to be interpreted as part of the role that consumption plays in political citizenship and moral subjectivity. The food practices of poorer Australian households are essentially household budget and family nourishment practices not nutrition and sustainability practices; a position which challenges proposed government food and nutrition policies.

Key words: moral economy, ecological citizenship, sustainability.

PO3127

PERCEPTION OF BODY IMAGE AND ITS RELATIONSHIP TO DIET IN WOMEN INDIGENOUS MAYAN COMMUNITIES IN YUCATAN, MEXICO

O. Pérez[1], A. Nazar[2], S. Pérez-Gil[3], T. Castillo[4], R. Mariaca[2]

[1]Universidad Intercultural Maya de Quintana Roo, Quintana Roo, México
[2]El Colegio de la Frontera Sur, Chiapas, México
[3]Instituto Nacional de la Nutrición, Ciudad de México, Distrito Federal, México
[4]CINVESTAV-Unidad Mérida, Yucatán, México

Background and objectives: Little research dealing with the study of the perception that people have about their body image and its relationship to diet and that are necessary to understand the reason for the excessive increase of this health problem. Our objective was to analyze the perception of body image and its relationship to the regular diet of adult women in two Mayan communities.

Methods: The research was conducted in two indigenous Mayas of Yucatan. The study is qualitative, descriptive and analítico. We selected 10 people in a community, and 12 of the other, were interviewed in depth and to know the perception of body image were selected from among 9 different silhouettes of women and men, and asked the usual diet. They were divided into age groups: 18 to 29 years, 30 to 59, and 60 and over.

Results: People chose silhouttes with images of women and men with overweight and obesity, because it is perceived

also believe that being 'thick (as)' not bad is synonymous with affluence. The power they have is based on foods of the culture, but found a great consumption of rich industrialized simple carbohydrates and saturated fats which shows a change in diet.

Conclusions: Culture plays an important role in the perception of body image, and needs to be addressed in public policy and nutrition programs are implemented, it is important to recognize the dietary change in these populations.

Key words: perception, food, image, culture.

PO3128

FACTORS CONTRIBUTING TO THE ADULT POPULATION DIETARY CHANGE IN INDIGENOUS MAYA

O. Perez[1], A. Nazar[2], S. Pérez-Gil[3], T. Castillo[4], R. Mariaca[2]

[1]Universidad Intercultural Maya de Quintana Roo, Quintana Roo, México
[2]El Colegio de la Frontera Sur, Chiapas, México
[3]Instituto Nacional de la Nutrición, Ciudad de México, Distrito Federal, México
[4]CINVESTAV-Unidad Mérida, Yucatán, México

Background and objectives: The food modernization has led to increased availability of processed foods, this eating pattern has been considered the 'Western diet' has changed the traditional diet of the people of rural and indigenous communities and is associated with the increase in rates of overweight and obesity. The objective of this study was to identify the factors that contribute to the adult population dietary change in indigenous Maya.

Methods: This is a quantitative study correlate transversal. We performed a systematic sampling without replacement, for selection to the 51 families who underwent structured interviews about socioeconomic status, feeding, migration, food production and governmental programs. Was conducted in two indigenous Maya of Yucatan.

Results: Is observed that the consumption of processed foods cutting is leading to modern dietary modification, is in a transitional stage of a more urban food less nutritious, high energy density, high fat, sugar, salt and high content of additives. And that migration and government financial support is contributing to dietary change.

Conclusions: It should recognize the value of the usual diet associated traditional Mayan milpa cultivation and food production in the home, which according to him is threatened but found time to rescue.

Key words: feeding, changing, production, migration, programs.

PO3129

THE USE OF CULINARY BOTANICALS FOR COMMON DISEASES AS WELL AS KILLER DISEASES AMONG THE RESIDENTS OF BOSTON MASSACHUSETTS USA

A H. Mollik[1]

[1]Department of Natural and Social Sciences, Participatory Advancement Social Service, Bangladesh

Background and objectives: Investigations on traditional healthcare have always offered immense scope for the development of new drugs and opportunities for alternative drug sources. The investigations were conducted in different neighborhoods and even urban areas of Boston within Massachusetts United States of America.

Methods: The data adduced is based on personal interviews, observations, and experiences of elder residents in the Boston Massachusetts. Residents from different castes and immigrants such as Asian, Black/African American, Hispanic/Latino, White, and people from urban areas were carefully interviewed. The culinary botanicals are generally used in the form of staple food, leafy or fruit vegetables, spices or condiments. Voucher specimens were collected and identified by referring standard flora.

Results: Information on 78 culinary botanicals belonging to 65 genera and 51 families are being communicated. Information regarding local remedies related especially to the culinary botanicals used as food and food adjuncts were recorded. The residents of Boston employ them also as local medicines in treating various human ailments. Even they are used raw or sometimes simply warmed. In many cases, they use them as a sole drug or occasionally supplemented by other botanicals or substances. They used these to combat common diseases such as migraines, rheumatic or joint pains, acidity, scabies, wounds, injuries, pimples, jaundice, constipations, amoebic dysentery, coughs, menstrual complaints, stomachaches, toothaches, flatulence, burns, indigestions, eye-burning, fevers etc. as well as killer diseases.

Conclusions: It was found that some of the information has not so far been available in literature. The method of preparation and mode of action is also simple and convenient. The investigations indicated that the knowledge is to be transferred properly by old people to younger generation and should be trained in collection and processing.

Key words: Black/African American, Hispanic/Latino, White.

PO3130

MEDITERRANEAN DIET IN NON-NATIVE ALGARVE RESIDENTS

M. Martins[1], E. Pinto[1], M P. Mateus[1]

[1]Centro de Estudos e Desenvolvimento em Saúde, Escola Superior de Saúde da Universidade Do Algarve , Portugal

Background and objectives: Even if Mediterranean Diet (MD) is associated with a longer lifespan and better quality of life, several barriers can limit the adoption of this food consumption pattern by individuals in non-Mediterranean countries. Analysis of food intake in migrant populations can contribute to the study of the determinants of food choice, specifically of the role of food item availability and of eating behaviour changes with migration. This study aims to assess changes in eating habits after migration in non-native residents of a region with a traditional MD.

Methods: A sample of 41 individuals in a non-urban Municipality was interviewed by a Dietetics and Nutrition professional in order to collect information on socio-demographic characteristics, selected food items intake frequency, reported changes in food behaviour and adherence to the MD according to the 14-point Mediterranean Diet Adherence Screener (MEDAS).

Results: The sample was composed by individuals originating from the United Kingdom, Germany and Eastern Europe, living in Portugal for a mean of 10.4 years (SD=7.55 years). 70.7% of the sample reported significant changes in food intake after moving to Portugal, mainly in the increased intake of vegetables (43.9%), fresh fish (29.3%) and olive oil (26.8%). Mean and median scores for MD adherence were 7 points (SD=1.8 points), implying a modest accordance with MD. No significant correlation ($p>0.05$) was found between MEDAS score and age, origin, marital status or years of residence in Portugal.

Conclusions: Food item availability and offer seems to have contributed to the increase of accordance with the MD in natives from non-Mediterranean countries, independently of age, origin and years of residence in Portugal. Further studies with migrant communities can help assess non-Mediterranean individuals' perception of MD and to tailor health promotion activities in these communities.

Key words: Mediterranean diet, MEDAS, eating behaviour.

PO3131

THE MEDITERRANEAN DIET IN THE ALGARVE (PORTUGAL)

M P. Mateus[1], E. Pinto[1], P. Graça[2]

[1]Centro de Estudos e Desenvolvimento em Saúde; Área Departamental de Nutrição e Dietética; Escola Superior de Saúde Da Universidade Do Algarve, Portugal

[2]Faculdade de Ciências da Nutrição e Alimentação da Universidade do Porto, Portugal

Background and objectives: Mediterranean Diet (MD) represents a complete food consumption pattern with health benefits associated with longer lifespan, better quality of life and with a decreased risk of hypertension, cardiovascular disease and obesity. The Algarve is a region located in the south of Portugal where traditional eating habits show many similarities with the MD, evident in the intake of fundamental elements such as bread, legumes, vegetables, fruits, olive oil and wine. These similarities contributed to the Algarve having been chosen as a Portuguese representative region for the application of MD to intangible heritage of UNESCO. This work aims to analyze, for the first time in the region, food habits of Algarve households and assess their similarities and adherence with traditional Mediterranean eating habits.

Methods: Data was collected in a sample of 311 households, following the development of a food intake and food habits questionnaire, fulfilled by the responsible for the purchase and/or preparation of food in each household.

Results: Fifty-four percent of respondents grow their own vegetables, fruit or olives, which shows evidence of the rural features of the Algarve traditional food habits, similar to the MD. Regarding traditional cooking practices, 44.8 % of the respondents usually cooked typical recipes of the Algarve. Respondents who reported not cooking typical recipes presented as main reasons the lack of time for cooking and personal or family preferences for other type of recipes, especially by the children. Most respondents (54.4%) considered Algarve recipes as healthy, and a positive correlation with age ($r=0.175$; $p=0.011$) shows that older respondents seem to consider the traditional eating habits healthier than younger ones .

Conclusions: This study revealed the need to promote traditional food habits in the region, especially in the younger population.

Key words: Mediterranean diet; eating habits; cooking habits.

PO3132

A PILOT STUDY OF A NOVEL mHEALTH INTERVENTION TO IMPROVE COMPLEMENTARY FEEDING PRACTICES IN HARYANA STATE, INDIA

N. Singh[1], C. Free[1], E. Ferguson[1], N. Bhandari[2], S. Taneja[2], S. Mazumder[2]

[1]Department of Population Health, London School of Hygiene and Tropical Medicine, UK
[2]Centre for Health Research and Development, Society for Applied Studies, New Delhi, India

Background and objectives: The spread of mobile phone (MP) technology in India provides new opportunities for delivering health interventions to vulnerable populations. This study aimed to develop and pilot test a MP-based nutrition counselling intervention to improve infant complementary feeding (CF) practices in a rural district in Northern India.

Methods: A MP-based nutrition counselling intervention was developed using formative research (focus groups and consultative workshop) in collaboration with India's Integrated Child Development Services community health workers (AWWs), community members, relevant experts and other stakeholders in Haryana State. A 6-week pilot test was undertaken with AWWs (n=12) and mothers of 9-11 month old infants (n=60). Changes in infant diet, maternal knowledge and attitudes toward CF practices were measured via questionnaires. The feasibility, acceptability, barriers, motivating factors, and suggested modifications to the intervention were assessed via in-depth interviews or focus groups with AWWs, mothers, and paternal grandmothers.

Results: At baseline, all participants reported being comfortable with using a MP, but only 26.7% of mothers (n=16) and 41.7% of AWWs (n=5) reported owning one. Compared to baseline, there was an increase in the median weekly intake of grains, legumes, fruit, added fats and eggs ($p<0.05$), in the proportion of infants meeting the promoted CF recommendations for these foods (37.3% vs. 64.1%, $p<0.05$), and in maternal knowledge regarding food consistency (61.6% vs. 86.4%, $p<0.05$ for porridges, 23.7% vs. 71.7% for milk, $p<0.05$). Overall AWWs, mothers and grandmothers felt that MPs were convenient, saved time and allowed increased contact; however, they also felt MPs were more useful to reinforce messages and should not replace routine face-to-face counselling; and money was a critical barrier to its use.

Conclusions: Using MPs to support CF counselling in Northern India is feasible and acceptable, and shows promise in improving infant diets.

Key words: mobile phones, complementary feeding counselling, India.

PO3133

ASSESMENT OF DIETARY INTAKE OBTAINED BY 24-HOUR RECALL INTERVIEWED IN REPRODUCTIVE AGED WOMEN LIVING IN KAMPOT AND SIEM REAP PROVINCES

Y. Nakanishi[1,2], S. Sowath[3], K. Kanal[4], B. Sokhal[5], N. Kaneda[1], T. Togami[2], T. Chan[3]

[1]Koshien University , Momijigaoka, Japan
[2]ILSI Japan CHP,Japan
[3]RACHA,Cambodia
[4]CMCHC,Cambodia
[5]NIPH,Cambodia

Background and objectives: Based on DHS 2010 more than 5 million Cambodians suffer anemia and are at risk for a host of threats to health and survival as well as performance deficits in school and in the workplace. We conducted 2 years-market trial of iron fortified fish/soy sauce (IFFS/IFSS) in Kampot, Siem Reap, and Phnom Penh. During the market trial, we investigated food sources and intakes of iron, and dietary factors associated with body iron status in reproductive aged women living in Kampot and Siem Reap provinces, Cambodia.

Methods: A cross-sectional survey employing proportionate cluster sampling was conducted during 2007 to 2009. Dietary intakes were assessed using 24-hour recall interview during dry and rainy season, respectively. Hemoglobin, serum ferritin and C-reactive protein were analyzed from non-fasting blood samples and general socio-demographic data were collected. The study was conducted in villages in 2 districts each in Kampot and Siem Reap provinces, Cambodia. We randomly selected healthy reproductive aged women (n=270).

Results: Total iron intakes (± standard deviation (SD)) among reproductive aged women in Kampot and Siem Reap provinces were 14.3 ± 4.8 mg /day and 13.2 ± 4.1 mg /day, respectively. Iron intakes during dry season were 14.4 ± 7.6 mg / day and 12.7 ± 4.0 mg /day, respectively. Iron intakes during rainy season were 15.1 ± 6.2 mg /day and 14.1 ± 5.6 mg /day, respectively.

Conclusions: Iron intakes among reproductive aged women were affected by living area and season in Cambodia.

Key words: anemia, food intakes, 24-hr recall, Cambodia.

PO3134

EVIDENCE OF THE NUTRITION TRANSITION IN AN ADULT MALE PUNJABI POPULATION IN MEDWAY, KENT UNITED KINGDOM

P. Amuna[1], S. Sarkar[1], F B. Zotor[2], T. Ndanu T[3], J. Tetteh[1], L S. Harbige[1]

[1]School of Science, University of Greenwich , UK
[2]Faculty of Medicine, University of Alberta, Edmonton Canada
[3]College of Health Sciences, University of Ghana Dental School Accra, Ghana

Background and objectives: Nutrigenomics and epigenetics are fast gaining ground as a major focus of cutting edge nutrition research; however, understanding the demographic, environmental and cultural dynamics of obesity and chronic disease risk remain fundamental to finding the right solutions under pattern five of the nutrition transition. In this study we sought to uncover links between inter-generational differences in lifestyle, shifts in dietary behaviour and physical and physiological markers of the nutrition transition in a homogeneous migrant Punjabi population in the UK.

Methods: Following a focus group study (n=40) of first and second generation migrant Punjabi adult males to obtain demographic and culturally specific information on food culture and trends in dietary behaviour and food choice, we randomly recruited 137 healthy male adults aged 21 - 55 yrs from a similar cohort for a detailed study of dietary behaviour using a prevaricated food frequency questionnaire and 3-repeat 24hr recalls, self-reported physical activity using the validated WHO Global Physical Activity Questionnaire (GPAQ). Anthropometric measurements, blood pressure and fasting serum glucose and lipids were also measured.

Results: Results show a low income group with median income of £19,850 compared to the UK national median of £29,000. Mean (SD) age of first and second generations were 40 (6.1) and 29 (3) years respectively. 91.3% of subjects were overweight or obese with BMI of 28.32 (2.2) and 28.68 (2.36). Similarly, waist circumference (WC), Waist-hip ratio (WHR), diastolic and systolic BP were 87.15 v. 88 cm; 0.87 v. 0.86; 86.65 v. 85.37; and 136.74 v. 133.62 mmHg respectively although these differences were not statistically significant. Mean SBP and DBP for both group indicate a prey pretension state; WC and WHR values were all above WHO cutoffs and in the high risk category for NCDs. Energy, protein, saturated fat, fibre, cholesterol and sodium intake were 3060 v. 3513 kcal/d; 101.88 v. 121.66 g/d; 36.01 v. 40.39 g/d; 386.93 v. 435.86 mg/d and 2550 v. 2631 mg/d in first and second generation respectively. Mean physical activity level (PAL) in both both groups 1.58 indicating a largely sedentary population.

Conclusions: We conclude that adult Punjabi male migrants in Kent, UK carry a very high risk of NCDs and demonstrate evidence of the nutrition transition.

Key words: Punjabi migrants, males, nutrition transition, chronic disease, Kent.

PO3135

BREAKFAST: ASSESSMENT, IMPACT AND PROJECTION IN ADOLESCENT STUDENTS IN THREE CONTINENTS.

A I. Mora Urda[1], G. Mengarelli[2,3], G. Scarinci[3], K. Anzid[4], M. Cherkaoui[4], P. Montero López[1]

[1]Departamento de Biología, Universidad Autónoma Madrid, Madrid, Spain
[2]Cát. Física Biológica-Fac. Cs. Médicas-UNR, Rosario, Argentina
[3]Centro de Salud "7 de Abril"-UNR, Rosario, Argentina
[4]Department of Biology, Laboratory of Human Ecology, University Cadi Ayyad, Marrakech, Morocco

Background and objectives: Breakfast is considered from scientific organizations that define the criteria for healthy eating, one of the most important meals of the day. The objective of this study was to analyze the differences in breakfast compliance in adolescents from different countries and the relationship between having breakfast and nutritional status (BMI).

Methods: The sample consists of three groups of adolescents (n=275), aged 12 and 18, from Madrid (Spain) (n=80), Ouarzazate (Morocco) (n=100) and Rosario (Argentina) (n=95). They were interviewed and measured in schools and colleges. The variables studied were: place of residence, sex, age, weight, height, breakfast compliance and breakfast features. Statistical Analyses were performed using the Statistical Package for Social Sciences (SPSS) 19.0.

Results: The percentage of breakfast compliance in each group was 92.5% in Madrid, 91.6% in Rosario and 40% in Ouarzazate ($p < 0.0001$). The 88.8% of Spanish, the 85.3% of Argentines and 59% of Moroccans included dairy products ($p < 0.0001$), 94% of Moroccans, 60% of the Spanish and the 27.4% of Argentines included cereals ($p < 0.0001$) and the 72.6% of Argentines, 33.8% of Spanish and 29% of Moroccans consumed bakery products at breakfast ($p < 0.0001$). Only statistically significant differences were found between the completion of breakfast and BMI in young Moroccans. The differences found between the Moroccan, and Spanish and Argentinean adolescents could be attributed to socioeconomic and cultural conditions that determine the possibility of having breakfast and could negatively impact the features (time, quality, commensality) of this meal in adolescence.

Conclusions: Although the scientific evidence on the importance of breakfast in childhood and adolescence, other determinants of eating behavior must be considered together to study the development of overweight and obesity from an early age.

Key words: Adolescence, childhood, eating behavior, obesity, overweight.

PO3136

DEMAND AND WILLINGNESS TO PAY FOR DIETARY DIVERSITY: RESULTS FROM AN EXPERIMENTAL APPROACH IN KASUNGU, MALAWI

A. Korn[1], I. Jordan[2], M B. Krawinkel[2], E A. Nuppenau[3]

[1]Department of Agricultural and Food Marketing, Faculty of Organic Agricultural Sciences, University Kassel, Witzenhausen, Germany

[2]Institute of Nutritional Sciences, Justus Liebig University, Giessen, Germany

[3]Institute of Agricultural and Environmental Politics, Justus Liebig University, Giessen, Germany

Background and objectives: Malnutrition of pre-school children remains a big challenge in Malawi. Promotion of dietary diversity with locally available and culturally acceptable foods might be one way to reduce malnutrition while maintaining economic independence. However, little is known about the willingness to pay for a nutritionally improved diet through dietary diversity in a resource poor setting. This study aims to examine expenditure patterns on dietary diversity and willingness to pay for a variety of local, but nutritious and healthy foods in Kasungu District, Malawi.

Methods: The study was set up as an economic field experiment with an artificial food market simulation. Food items of the experimental market were based on foods available at local markets and items that were potentially incorporated into the diet of farm family households in Kasungu. Participants (n=18) were provided with play money. The amount differed in accordance to different income group simulations. Furthermore, focus group discussions on farm households' expenditure patterns were conducted.

Results: Farm family households were willing to invest in dietary diversity, if income allowed. Participants given the most money had a statistically significantly higher dietary diversity compared to those given the least (p=0.028, n=18). However, statistical significance was not persistent considering a healthy dietary diversity. A higher income was associated with higher amounts of money spent on sweets. Focus group discussions unveiled that most of the products, consumed by a family, originate from own farming activities (50%), whereas 25% of food items are collected from the wild, and only 25% are bought.

Conclusions: A higher income does not necessarily lead to a purchase of local nutritious food. To improve malnutrition among children through a higher dietary diversity, nutrition education should be linked with agricultural production, agrobiodiversity, household production, and existing consumption patterns.

Key words: malnutrition, foods, willingness to pay.

PO3138

THE TRANSTHEORETICAL MODEL APPLIED FOR FRUITS, VEGETABLES AND FAT CONSUMPTION AMONG ADULTS ASSISTED IN A BRAZILIAN OUTPATIENT NUTRITION

L. Brito[1], R. Rocha[1], G. Simões[1], O. Raposo[1]

[1]Federal University Aracaju, Sergipe, Brazil

Background and objectives: The high prevalence of overweight and obesity is associated with increased morbidity and mortality due to cardiovascular disease. The Western dietary pattern was established as an important etiologic factor. Thus, nutritional education has been the subject of proposed nutritional interventions, in which those performed using the Transtheoretical Model have proven effective. The purpose of this study was to classify the stages of change for eating food behavior about fruit, vegetable and fat consumption of individuals seeking for nutrition assistance at the Federal University of Sergipe's Hospital.

Methods: In a cross-sectional study, a questionnaire was used to classify the Transtheoretical Model' stages of change for eating food behavior for fruit, vegetable and fat. It was made anthropometric measures (weight, height, body mass index and waist circumference) and the usual fruit, vegetable and fat intakes.

Results: Among the 33 participants, most of them presented overweight (78.8%) and increased abdominal adiposity (93.9%). It was observed that 72.7% presented low fruit consumption, 90.9% for vegetables and 51.5% high fat consumption, the first appointment group had higher inadequate fruit consumption than the return group. Most patients, 54.5%, 48.5% e 51.5% were classified as being in the Action/Maintenance group for fruit, vegetable and fat consumption, respectively. These patients also had a greater frequency of consumption for these food groups. Furthermore, there was inadequacy in the patients' conception relative to healthy consumption of fruits (50.0%), vegetables (81.3%) and fat (35.3%).

Conclusions: Most of the population studied was classified in overweight and obesity and substantially increased risk of developing cardiovascular disease. Patients showed inadequate intake of fruits, vegetables and fat, and according to the transtheoretical theory, were in greater proportion in the stages of Action/Maintenance. The nutritional intervention promoted improvements about the consumption of fruits.

Key words: feeding behavior, food consumption, nutritional status, nutrition assistance.

PO3404

CHANGING HEALTH PARADIGMS – CAN THE CONCEPTS OF WELLNESS AND WELLBEING BUILD BRIDGES IN DIETARY COUNSELLING?

A T. McMahon[1], T. Linda[1], P. Williams[1]

[1]School of Health Sciences, University of Wollongong, Australia

Background and objectives: Delivering a client or patient-centred counselling approach is a core competency for professional practice for dietitians. This aim of this research was to explore if the concepts of wellness and wellbeing could provide useful adjuncts for this approach by building bridges between biomedical imperatives and client perspectives on health.

Methods: To explore the current professional position, a literature search was conducted using keywords encompassing patient-centred care and competency within professional dietetic journals (2001-2010). To develop a contextual case study, 10 in-depth interviews with dietitians from a dietary weight-loss trial were conducted. Recordings of their perspectives on roles, opportunities/barriers, and counselling strategies were transcribed verbatim and examined using inductive thematic and content analysis.

Results: Eleven relevant articles were incorporated into the narrative review which described issues in practice relating to traditional forms of consultation and the effectiveness of various approaches. The over-riding theme in the interviews (Professional Identity and Competency Dilemma), highlighted the tension for dietitians in their dual role as nutrition expert and counsellor, and thereby the distance between biomedical imperatives (clinical targets) and client defined perspectives on health. The supporting themes (Adherence factors and Constructs of health) exposed details on the barriers to dietary change and the impact of contextual factors on this change respectively. All of these themes related to concepts of wellness and wellbeing.

Conclusion: Appreciating the concepts of wellness and wellbeing adds a useful adjunct to client centred approaches to dietary counselling by building bridges between clinical targets and client perspectives on health.

Key words: Wellness, wellbeing, dietary practice, Patient-Centred Care.

PO3405

CHEMICAL COMPOSITION, FATTY ACIDS CONTENTS AND GLYCEMIC INDEX OF TWO DIFFERENT TYPES OF OMANI HALWA

A. Ali[1], Al-Z. Khalid[1], M. Waly[1], A. Al-Alawi[1], D. Sankar[1,2]

[1]Sultan Qaboos University, Muscat, Omán
[2]WHO, Regional Office, Fukuoka, Japan

Background and objectives: Omani halwa is a traditional sweet dish of Oman that is not only served on special ceremonies/occasions but is also consumed in everyday life in Oman and Gulf region. The present study evaluated the chemical composition, fatty acids contents and glycemic index of two different types (white and black) of Omani halwa.

Methods: Representative samples were collected from the local market. The proximate composition and fatty acids contents were determined according to methods of AOAC (2000). Glycemic index (GI) was determined as described by Wolever et al. (1991) and FAO/WHO (1998).

Results: No significant ($P < 0.05$) differences were observed in proximate composition and energy content of both types of Omani halwa. The percentage moisture, crude protein, total fat, ash, crude fiber, and nitrogen free extract (NFE) in white and black halwa were 11.8 and 12.1, 0.28 and 0.44, 13.8 and 12.4 and, 0.01 and 0.02, 0.15 and 0.05, and 74.0 and 75.0 respectively. The energy values in white and black halwa were 421.3 and 413.4 kcal/100 g respectively. The fatty acids contents of both halwa varied significantly ($P < 0.05$). The percentage of saturated fatty acids (SFA), monounsaturated fatty acids (MUFA), and polyunsaturated fatty acids (PUFA) in white and black halwa were 63.29 and 68.53; 31.0 and 28.5; 5.6 and 2.9% respectively. Trans-fats were 11.7 and 15.01% respectively. The GI values for white and black halwa did not vary ($P < 0.05$) and were 54.8 ± 15.3 and 52.0 ± 16.5 respectively.

Conclusion: Although glycemic index value of these halwa falls in low GI category (< 55), it should be consumed with caution because of its high fat, in particular of SFA and high sugar contents.

Acknowledgements: Financial assistance was provided by SQU (IG/AGR/FOOD/01/11).

Key words: Omani halwa, proximate composition, fatty acids, glycemic index.

PO3406

EMOTIONAL DEPRIVATION, MALNUTRITION AND DEHYDRATION (3D) MODEL OF DETECTION, PREVENTION AND MANAGEMENT OF CHILDHOOD OBESITY

M E. Acosta[1]

[1]Universidad de Montemorelos, Nuevo León, México

Background and objectives: Childhood obesity is related to affective deprivation (child abuse) that adversely affects growth and potential development. This social condition creates vulnerability to health and wellness for this stage of life, together with the presence of chronic malnutrition and dehydration. The objective was to recognize the social, environmental and health factors related to development of childhood obesity in vulnerable populations.

Methods: Study descriptive observational, cohort. The study included 49 school children (7-12 years old), 58% male and 42% female. We performed anthropometric assessment (Weight, height, BMI) classified according to the WHO (2006); body composition using multifrequency bioelectrical impedance (team QuadScan 4000) and applied a questionnaire to determine the composition of the household and family ties. Analysis were conducted using SPSS version 17.0.

Results: Sixty percent of the population suffered familial dysfunctions. We found the following conditions: obesity, 31%; malnutrition, 58%; stunning, 47%; malnutrition, low stature, 74%, with body water below normal values for age. Conclusions: The children included in this study showed high vulnerability resulting from family dysfunction. They are at high risk of malnutrition, decreased lean mass and body water. They are at risk of developing obesity with associated comorbidities, such as diabetes and hypertension, given the family history of obesity and hypertension.

Conclusions: Interventions in health promotion to children and parents in the school and yours homeland will be the opportunity to change the lifestyle and the life quality in this vulnerable community.

Key words: Emotional deprivation, malnutrition, dehydration, children.

PO3407

LOW HOUSEHOLD DIETARY DIVERSITY IS A MAJOR PUBLIC HEALTH CONCERN FOR WOMEN IN COASTAL BANGLADESH

Z. Islam[1]*, H. Akram*[1]*, E. Hasib*[1]*, S F. Rashid*[1]*, S. Chowdhury*[1]

[1]James P Grant School of Public Health, BRAC University, Dhaka, Bangladesh

Background and objectives: Research indicated that dietary diversity is a good indicator of food security at household level. Women of reproductive age living in resource-poor setting are at risk of micronutrient deficiency. Present study was designed to evaluate the household dietary diversity and individual diversity for women in 3-impoverished districts (Satkhira, Khulna and Barisal) of southwest coastal Bangladesh (a part of Ganges Delta).

Methods: A total of 1536 households were selected to determine household dietary diversity score (HDDS). One woman (aged 15-49 yrs) per household was selected to ascertain the individual dietary diversity score (IDDS). A cluster sampling design was used and in each cluster, 24 households were selected systematically for interview and anthropometric measurements. Information on food intake was collected for 7-days. Food consumed during 7-days was condensed into 9 food groups. The range of possible HDDS was 0-63. The IDDS was assessed on 12 food groups consumed during last 24-hrs and score ranging 0-12. Other relevant data were also collected.

Results: The overall mean HDDS was very low (mean, SE; 32.4, 0.22). We found households in the district of Khulna most vulnerable ($P<0.0001$) compared with other 2-districts. The overall mean IDDS of women was also predominantly low and significantly lower ($P<0.0001$) in the District of Khulna compared with other 2-districts. Low BMI values (BMI <18.5 kg/m2), and a high prevalence of anaemia were observed. Physical characteristics such as height, weight, MUAC and BMI were not significantly different in three districts.

Conclusions: The results of the study indicated that women in Khulna district might be the most vulnerable to nutritional problems and may be at high risk of micronutrients deficiency. Urgent integrated agriculture interventions are warranted for improved food and nutrition security in this region.

Key words: Anaemia, dietary diversity, micronutrients deficiencies, women.

PO3408

NUTRITIONAL ANALYSIS OF THE 25 MOST FREQUENTLY CONSUMED DISHES IN A SLUM IN IQUITOS, PERUVIAN AMAZON

G. Molina Recio[1], M. García Rodríguez[2], R. Moreno Rojas[1], M. Vaquero Abellán[1]

[1]University of Cordoba, Cordoba, Spain
[2]Arkofarma, Cordoba, Spain

Background and objetives: The aim was to determine the nutritional value of the main dishes consumed by the residents of a slum in Peruvian Amazon, to identify the causes of loss of its nutritional status.

Methods: 98 participants completed three 24-h recalls. Based on these data, we selected the 25 most commonly eaten dishes and evaluated their nutritional composition. We took note of the recipes, homemade weights and measures. In addition, we observed the preparation and cooking. The mean nutritional composition of each dish was calculated per 100 g using the software Nutriplato 4.6. We calculated gains or losses resulting from culinary treatments.

Results: Within that include milk, the highest energy density is the 'Mashed rice'. In the group of fish, the most energy is the 'Fish Fry', in the meat-based recipes, the 'Chicken Noodle', 'Roast Beef" and "Fried Pork". As prepared dishes, the 'Juane' is the highest energy density of all recipes. Inside garnish, using bananas as the main ingredient, 'Fried Banana' and "Ripe banana' are the most energetic. Fats are higher in fried dishes and those which contribute most fat ratio. The same thing happens with garnish, where 100 grams of 'Fried Banana' or "Ripe banana' contain more than 70% of the RDA. 'Roast Beef" ' and 'Juane' have the higher sodium level.

Conclusions: It's necessary to change some eating habits, reducing the consumption of fried foods because probably is related to obesity and other chronic cardiovascular diseases. It should also reduce sodium intake. Two foods could be important: "Chicken giblets", rich in B vitamins and low in fat, and "Boiled beans" that are rich in vegetable protein and that, with rice dishes ubiquitous in this area, increases the biological value of the proteins ingested

Key words: Nutritional analysis, recipes, peruvian amazon, SLU.

WASHING THE FOODSTUFFS OF SEEDS, PROMOTING THE HEALTH LEVEL, A PROPOSAL FOR LEGISLATION OF NATIONAL STANDARD OF FOOD SAFETY

X. Han-You[1]

[1]Department of Internal and Emergency Medicine, Clinical Institute, Workers Hospital of Nanyang Textile Corporation, Nanyang City, Henan Province, China

Background and Objectives: As the bad situation of pollution in the foodstuffs of seeds in and outside of China is more and more serious and critical. There is not any concrete regulation or national process standard of food safety to eliminate or reduce the pollution in the foodstuffs of seeds round the world. It is imperative to eliminate the danger pollution factors in the foodstuffs of seeds for promoting people's health around the world before the pollution factors are eat and harm the human-being.

Methods: Summarize the bad situation of pollution in the foodstuffs of seeds around the world.

Results: Washing the foodstuffs of seeds to eliminate the danger pollution factors in the foodstuffs of seeds, promoting the health level, and a proposal for legislation of national standard of food safety was created.

Conclusions: The proposal for washing the foodstuffs of seeds, promoting the health level, a legislation of national standard of food safety was suggested to promote health food and health people around the world.

Key words: Proposal, legislation, National standard of food safety, Foodstuffs of seeds, Health promotion, Washing.

FIBER AS A NUTRITIONAL CHARACTERISTICS IN LEAF PROTEIN EXTRACTED FROM POTATO LEAVES

J. Shanker[1]

[1]Division of Agricultural Biochemistry, Kulbhaskar Ashram PG College, Allahabad, INDIA

Background and Objectives: The wide spread prevalence of diet-related health problems, particularly in high industrialized nations, suggests that many humans are not eating in a manner compatible with their biology. Analysis of vegetable leaves routinely consumed by wild primate's shows that many of these foods are good sources of hexoses, cellulose, hemicelluloses, pectic substances, fiber, vitamin C, minerals, essential fatty acids, and protein. Leaf proteins are very recent novelty in human nutrition where the use of vegetable protein is very common.

Methods: Wet fractionation of leaf protein constituent is used for two purposes: i) to obtain fiber and ii) to obtain structural lipoproteins.

Results: Biochemical studies were made to determine nutritional characteristics particularly the fiber in the leaf protein concentrate (LPC) fractionated from potato (Solanum tuberosum L.) Leaves selected for the analysis . Fiber content was found to be maximum in unfractionated fraction followed by fractionated cytoplasmic then fractionated chloroplastic fraction of the LPC. The presence of higher fiber content is an indication of providing more skeletal strength and high degree of tensile strength to support the aerial part of the plant. It appears that due to low fiber content in LPC obtained from fractionated fraction will have better digestibility and higher nutritive value. The quality of feeding stuff is adjudged by lower crude fiber content. Low content in crude fiber and high in carbohydrate feeds are valued as supplements to hay & fodder components of the animal ration.

Conclusions: It promotes a number of positive physiological effects, helping to prevent constipation, lower blood cholesterol levels and control glucose levels.

Key words: Leaf protein, new food supplement, green crop fractination.

SURVEY OF AFLATOXIN M1 CONTAMINATION IN PASTEURISED MILK

R. Kazemi[1], M. Azizollahi Aliabadi[2], A. Amini[1]

[1]Young Researchers Club, Islamic Azad University of Lahijan, Iran

[2]MS in Microbiology, Islamic Azad University of Lahijan, Iran

Background and Objectives: Aflatoxins (AF) are mycotoxins produced by certain fungi, especially Aspergillus flavus. Aflatoxin M1 (AFM1) is a hepatocarcinogen found in milk of animals that have consumed feeds contaminated with aflatoxin B1 (AFB1). These metabolites are not destroyed during the pasteurization and heating process. This study was undertaken to determine the presence and levels of aflatoxin M1 (AFM1) in pasteurised milk consumed in the province of Giluan, Iran.

Methods: A total of 40 samples were randomly obtained from retail outlets. Enzyme Linked Immuno Sorbent Assay (ELISA) technique was used to determine the presence and evel of AFM1.

Results: In 35 of the 40 milk samples examined (87.5%), the presence of AFM1 was detected in concentrations between 7.2ng/l and 98.0ng/l. AFM1 concentration in 28 samples (70%) was higher than the maximum tolerance limit (50 ng/l) accepted by some of the European countries.

Conclusion: The results of this study imply that more emphasis should be given to the routine AFM1 inspection of milk and dairy products in the Iran region. Furthermore, both farmers and dairy companies should be informed on the importance of AFM1, and the consequences of the presence of the aflatoxin in dairy products.

Key words: Aflatoxin M1, ELISA, pasteurised milk.

PO3143

PROTEIN DETERMINATION OF AN HYDROLYSED RICE-BASED INFANT FORMULA IN CHILDREN ALLERGIC TO COW'S MILK PROTEINS

S. Addou[1], A. Merzok[1], A C.Brahimi[1], O. Kheroua[1], D. Saidi[1]

[1]Laboratoire de La Nutrition et de La Sécurité Alimentaire, Département de biologie faculté des sciences, Université d' Oran, Algérie

Background and objectives: Infants allergic to cow's milk proteins raise the question of the choice of replacement milk formulas often of hydrolyzed cow's milk may contain residual allergens and there are few options nutrition. In recent years a new form of hydrolysates of rice has been commercialized. These formulas based on hydrolyzed rice, until now used, could therefore be proposed as an alternative to allergy to cow's milk and used as a source of proteins. The aim of our work is to study the biochemical characteristics of an infant formula hydrolysates of rice.

Methods: Our work has enabled us to make an approach to the biochemical characterization of the infant formula hydrolysates of rice by determining the protein content by the Lowry method. We performed a polyacrylamide gel electrophoresis to determine the different proteins that make up the infant formula.

Results: The protein content of infant formula containing partially hydrolyzed rice is close to the protein concentration in breast milk. This concentration is well suited to the needs of infants due to high absorption and a perfect match of the profile its amino acids. The analysis of infant formula protein hydrolysates of rice by electrophoresis allowed us to identify clear protein bands which shows the absence of intact proteins and ensures that the hydrolysis and partial.

Conclusion: The commercial formula based on hydrolyzed rice is adapted to cover the nutritional needs of infants due to its protein content and excellent absorption. This infant formula was treated by technological methods to reduce the antigenic potential and the allergen.

Key words: Infant Formula, Electrophoresis, Allergy cow's milk, Proteins, hydrolysates of rice.

PO3143

PROTEIN DETERMINATION OF AN HYDROLYSED RICE-BASED INFANT FORMULA IN CHILDREN ALLERGIC TO COW'S MILK PROTEINS

M. Amel[1], A. Samia[1], B. Amina Chérifa[1], K. Omar[1], S. Djamel[1]

[1]Laboratoire de La Nutrition et de La Sécurité Alimentaire, Université D'Oran, Oran, Algiers

Background and objectives: Infants allergic to cow's milk proteins raise the question of the choice of replacement milk formulas often of hydrolyzed cow's milk may contain residual allergens and there are few options nutrition in children with allergy Cow's milk also react to soy. In recent years a new form of hydrolysates of rice has been commercialized. These formulas based on hydrolyzed rice, until now used in children with allergies to cow, could therefore be proposed as an alternative to allergy to cow's milk and used as a source of proteins. The aim of our work is to study the biochemical characteristics of an infant formula hydrolysates of rice for children with allergies to cow's milk.

PO3144

CHEMICAL COMPOSITION AND NUTRITIONAL EVALUATION OF SOME FAST FOODS

E. El-Kholi[1], G. El-Kherbawy[2], S. Aldaghri[2], S. Zaki[2]

[1]Nutrition & Food Science Department, Faculty of Home Economics, Menufiya University, Egypt
[2]Deptartment of Food Science, Home Economics Division, Faculty of Agriculture, Cairo University, Egypt

Background and Objectives: The availability of foods high in fat and energy dense through fast foods (FF) or taking away restaurants was associated with poor quality diet. The present investigation aimed to assess the nutritive values of some FF meals.

Methods: Eleven FF meals, from four brands of local worldwide chains, were evaluated for proximate composition. Meals included beef and chicken burgers or nuggets.

Results: The obtained results proved that moisture contents of FF meals fluctuated between 36.70 and 51.30 %. The contents of protein were 13.61- 26.31%, fat 33.42- 43.67%, carbohydrates 25.38- 42.32%, fibers 4.26- 7.05 % and ash 1- 1.89 % on dry weight basis. The highest protein content was found in chicken nuggets. Beef burgers obtained from different places had close protein contents that were higher than those of chicken burgers. Chicken burgers also had close protein contents regardless, the kind of FF outlets. No appreciable differences in ash contents but slight variation in fiber contents were observed among FF meals. All FF meals were high energy dense that very high in fats and calories. Burgers showed close fat contents regardless the kind of FF meals, fat contents represented more than one third of its composition. The estimated energy of FF meals reached 545.65 - 598.77 calories/100g meal. However, mineral contents of different FF were low. Slight differences were noticed among the percentages of fiber and ash contents of FF meals.

Conclusions: Despite the relatively high percent of protein content of FF meals, there is a broader impact that they might have on overall diet. FF with high fat and low mineral contents indicated poor nutritional quality that increase risk health.

Key words: Fast foods, Chemical evaluation, energy dense.

PO3145

RAPID ASSESSMENT OF THE VALIDITY AND QUALITY OF CHICKEN MEAT BASED ON SENSORY AND PHYISCAL METHODS

A. Ahmed[1], S. Ismail[2]

[1] Deptartment of Food hygiene, Suez Canal University, EL SALAM DISTRICT, ISMAILEYA, Egypt
[2] Deptartment of Food Hygiene, Suez Canal University, Ismailia, Egypt

Background and Objectives: Chicken meat is highly desirable food which contains high biological value proteins, vitamins, and minerals, beside its relatively economical price in comparison to other red meat. The first consumer right is to have a meat of good quality and entirely not hazardous to the public health.

Methods: A total of 96 samples of chilled chickens were used to evaluate their sensory and physical quality. The samples were randomly subdivided into equal 6 subgroup maintained at 3 ±1°C where evaluated daily based on the parameter of color, odor, cooking loss and moisture content until the end of their shelf-life.

Results: There were significant variation ($p<0.05$) in all color coordinates (L*, a* and b*) among the examined chicken meat samples. The odor of chicken meat samples of chicken meat remains acceptable for days 0, 1, and 2, whereas after 3, 4, and 5 days of storage had more noticeable off-odors. The examined samples recorded loss of 24.5% of its original weight at day 0, whereas at day 5 had, an average, 37.0%.

Conclusion: Several deteriorative changes occurred in sensory and physical parameters of the chicken meat along the chilling storage period. The update sensory and physical methods could be useful as a rapid method for evaluation the shelf-life of chicken meat.

Key words: Chicken meat, color, odor, cooking loss, moisture content, shelf-life.

PO3147

EFFECTS OF DIETARY ALUMINOSILICATES ON BIOCHEMICAL CHANGES IN BROILER CHICKENS DURING OCHRATOXICOSIS

M. Popovic[1], D. Prvulovic[1], D. Kojic[2], G. Grubor-Lajšic[2]

[1]Faculty of Agriculture, University of Novi Sad, Novi Sad, Serbia

[2]Faculty of Science, University of Novi Sad, Novi Sad, Serbia

Background and Objectives: Ochratoxicosis in animals and humans causes biochemical and histopathological changes in major organs. Producers and researchers desire to develop an effective decontamination technology dealing with this feed-borne toxin. The non-nutritive aluminosilicates such as clays and zeolites possess high binding capacities against several toxins from the gastrointestinal tract. The purpose of the present study was to evaluate the toxic effects of ochratoxin A (OTA) by biochemical examination of liver, spleen and pancreas of broilers, and to determine the possible preventive role of dietary aluminosilicates (mixture of clay bentonite and zeolite clinoptilolite) on investigated values.

Methods: In total 84 broiler chicks were divided into two treatment groups: control-basal diet and basal diet plus 5 g aluminosilicate kg-1 diet. After 21 day, twelve hours prior to sacrifice, 21 chicks from each group received one dose of OTA orally.

Results: The activity of catalase in pancreas and superoxid dismutase, catalase, guaiacol peroxidase and pyrogallol peroxidase in spleen increased after oral administration of single dose of OTA to broilers. Lipid peroxidation was significantly increased only in spleen. The supplementation of the aluminosilicates partially decreased these negative effects. No significant effects due to OTA were observed in enzymes activity of liver.

Conclusions: This data suggest that single dose of OTA could provide a toxic alleviating effect on antioxidant indices of spleen of broilers. Therefore, aluminosilicates partially protects animals against the harmful effects of OTA.

Key words: Aluminosilicate, broilers, clay, ochratoxin A, zeolite.

PO3148

LEVEL OF HEAVY METALS IN AFRICAN RED SNAPPER (LUTJANUS AGENNES) CAUGHT OF THE COAST OF ACCRA

H. Ofori[1], C. Diako[1]

[1]Food Chemistry Division, CSIR-Food Research Institute, Accra, Ghana

Background and Objectives: Fishery sector in Ghana serve as a source of protein for most Ghanaians but one issue of public health concern is the accumulation of heavy metals. Domestic and industrial waste all find their way into the sea.The sea has now become a hub of waste instead of reservoir for fish. In the present study, levels of Cu, Fe, Mn, Pb and Zn in African red snapper fish was monitored from Nov. 2011 to March 2012. Method: Four fish samples were collected monthly from Jamestown in Accra along the coast. 5g muscle, 4g gills and 4g bones was dry ashed and absorbance reading of sample solutions read using Flame Atomic Absorption Spectrophotometer. The content of metals determined from calibration curve made of not less than three standards.

Results: The order of heavy metal accumulation was Fe>Pb>Zn>Mn>Cu for bones, Fe>Zn>Pb>Mn>Cu for gills and Fe>Pb>Zn>Mn>Cu for muscle. The mean concentration of Cu, Fe, Pb, Mn, and Zn in the muscle, the part of fish normally eating, was 0.70, 8.98, 7.30, 0.77 and 4.36 mg/kg respectively.

Conclusion: The mean concentration of metals analysed during the five months period were mostly above the WHO limit and this posed risk to human health. There were variations in the level of heavy metals during the five months study period.

Key words: Fish, Accumulation, Heavy metals, African red snapper.

PO3149

CONCENTRATION OF SERUM ENZYMES IN MALE ALBINO WISTAR RATS FED RAW BENISEED AND BENISEED SOUP DIETS

M. Agiang[1], A. Essien[2], M. Eteng[1]

[1]Department of Biochemistry, University of Calabar, Calabar, Nigeria

[2]Department of Animal Science, University of Calabar, Calabar, Nigeria

Background and Objectives: There had been an age long complaints by men, in some communities in Nigeria, of painful urination after a beniseed (Sesamum indicum) soup meal that is not "properly cooked". This has led to the prolong cooking of the soup in order to reduce the cause of the pain. This

study was thus conducted to find out the effect of consuming beniseed soup cooked for longer times on the concentration of prostate specific antigen (PSA) and some serum enzymes in albino Wistar rats.

Methods: Beniseed soups were cooked, using the same recipe, for 15, 30, 45 and 60 minutes respectively yielding four batches of soup samples (BSS-15, BSS-30, BSS-45 and BSS-60 respectively). Forty two male albino Wistar rats, (six groups of seven rats each), were used in this study. Group I was fed reference (casein) diet, group II (BS-R) raw beniseed, groups III, IV, V and VI diets BSS-15, BSS-30, BSS-45 and BSS-60 respectively. At the end of the 21 days feeding period, enzyme assays were done using standard methods.

Results: There was no significant ($p>0.05$) difference in the PSA concentration between the test and reference groups except groups BSS-45 and BSS-60 whose values (0.39±0.17 and 0.36±0.28ng/ml respectively) were low. There was no particular trend in the values of the other metabolic enzymes (ALP, ALT, GGT, AST, TACP and PP) with respect to the length of cooking time.

Conclusions: The assessment of AST, ALT, ALP and GGT activities, being indicators of liver tissue integrity, showed that consumption of either raw beniseed or beniseed soup is not hepatotoxic. The low values of PSA, compared to values of the reference, provides evidence that there was no pathology of the prostate tissue hence prostate function is not affected by consumption of beniseed.

Key words: Beniseed soup, enzymes, painful urination, prolong cooking.

PO3150

BIOLOGICAL CONTROL OF GRAY MOLD OF APPLE BY HANSENIASPORA OCCIDENTALIS IN COMBINATION WITH SODIUM CARBONATE

H R. Etebarian[1], M. Azadrooh[2], H. Aminian[2]

[1]Islamic Azad University Shahr-e-Rey Branch, Tehran, Iran

[2]Abureihan College, University of Tehran, Tehran, Iran

Background and objectives: Gray mould caused by Botrytis cinerea results in major losses of apple and can be controlled effectively by fungicides , but the development of fungicide resistance by pathogens and increasing environmental concern over fungicidal residues in fruits stimulated a search for alternative measures for disease control. In this study the effect of Hanseniaspora occidentalis strain M46 alone and in combination with sodium carbonate (SC) in storage condition at temperature of 20 and 5˚C was evaluated.

Methods: The Golden delicious apples were disinfected and wounded by sterile nail. Each wound was treated with 40 µL of antagonistic yeast suspension, SC solution in different concentrations (0, 0.3, 0.5 and 1% wt / vol), antagonist suspension amended by SC and sterile distilled water as the control. After 24 h, 20 µL of spore suspension of pathogen were applied. At 4˚C after 31 days and in room temperature after 15 days, the lesion diameter was measured. The completely randomized design was used for experiments.

Results: The results indicated that when the apples treated with H. occidentalis or SC at concentration of 1%, the lesion diameter was significantly less than pathogen control.

Conclusions: The results indicate that H. occidentalis in combination with sodium carbonate affects apple responses to B. cinerea and could be an important method for control of apple gray mould.

Key words: Apple, Botrytis cinerea, sodium carbonate , biological control.

PO3151

METHYL JASMONATE IN COMBINATION WITH METSCHNIKOWIA PULCHERRIMA AND HOT WATER ON CONTROL OF APPLE BLUE MOLD CAUSED BY PENICILLIUM EXPANSUM

H R. Etebarian[1], L. Ebrahimi[2], S. Farhangian-Kashani[1], H. Aminiam[2]

[1]Islamic Azad University Shahr-e-Rey Branch, Tehran, Iran

[2]Abureihan College, University of Tehran, Tehran, Iran

Background and objectives: Blue mould caused by Penicillium expansum is the most important postharvest disease of apple and produces the carcinogenic mycotoxin patulin in decayed fruits. Blue mold is controlled by the application of fungicides, but fungicide toxicity caused the public concern requiring the development of alternative to synthetic fungicides. It has been reported that methyl jasmonate (MeJA) treatment can reduce postharvest diseases of grapefruit and peach. In this study the effect of MeJA alone and in combination with Metschnikowia pulcherrima or hot water in storage at temperature of 20 and 4 ˚C was evaluated for control of apple blue mould.

Methods: Golden delicious apples were disinfected and wounded by sterile nail. Each wound was treated with 30 µL of M. pulcherrima suspension, MeJA solution in different concentrations, antagonist suspension amended by MeJA and sterile distilled water as the control. After 24 h, 20 µL of spore suspension of pathogen was applied. At 4˚C after 50 days and at 20˚C after 15 days, the lesion diameter was measured. In the other experiment the apples were immersed in hot water at 40

and 50 ˚C for 1, 2 or 3 min and then 20 µL of each concentration of MeJA was dispensed in each wound. Twenty four hours later, the apples were inoculated with pathogen.

Results: Results indicated that combination of MeJA with yeast reduced the disease better than MeJA and yeast alone and also the lesion diameter in the apples which were immersed in hot water at 40 ˚C for 1 min and then treated with 500 µmol/L MeJA was significantly less than pathogen control.

Conclusions: In conclusion the results indicate that MeJA especially combination with M. pulcherrima or hot water could be an important method for control of apple blue mold.

Key words: Apple, Penicilliun expansum, methyl jasmonate.

PO3152

EFFECTS OF ESSENTIAL OIL FORMULATIONS ON THE ADULT INSECTS TRIBOLIUM CASTANEUM (COL. TENEBRIONIDAE) AND SITOPHILUS ORYZAE (COL. CURCULIONIDAE)

A. Popovic[1], J. Sucur[1], M. Popovic[1], D J. Malencic[1], D. Stajner[1], P. Strbac[1], M. Petrovic[1]

[1]Faculty of Agriculture, University of Novi Sad, Republic of Serbia

Background and Objectives: Management of stored product pests, using essential oils as the substances of natural origin, is nowadays the subject of much research. Stored product pests such as Tribolium castaneum (Herbst, 1979) and Sitophilus oryzae (Linnaeus, 1763) are a major problem.

Methods: Adult insects were obtained from laboratory cultures maintained in the dark in incubators at 25 C and 70–80% r.h., reared on wheat flour and on grain wheat. Both insects species were fed with flour disks containing a known concentration of essential oil taken from 7 plants. The chemical components of essential oil taken from 3 plants (Calamintha glandulosa L., Satureja montana L., Teucrium polium L.) were identified using GC-MS analysis. Insecticidal effect of essential oils, that is, mortality rate of adult insects was tested after 24h, 48h, 72h.

Results: In our research, the essential oil taken from C. glandulosa which were rich in monoterpene alcohols carvacrol and contained ketonic component showed strong insecticidal activity against adults of T. castaneum and S. oryzae. Therefore, it was observed that essential oil from C. glandulosa at concentration of 1.14% showed powerful toxic and repellent effect on T. castaneum insects, with very high mortality rate after 24h (56,67%). Also, mortality of Sitophilus oryze was strong and it was 85%, after 24h at concentration of 1,5% essential oil. After 48h, the most effective formulation was, again, C. glandulosa with 83.33% mortality on the T. castaneum and with 100% on the S. oryzae. Less toxic effect showed essential oils of Satureja montana and Teucrium polium which had a lower carvacrol and ketonic content.

Conclusions: Taking into account our results and other references it could be concluded that carvacrol has very broad insecticidal and fumigant activity.

Key words: essential oils, mortality rate, Tribolium castaneum, Sitophilus oryzae

PO3153

HAZARDOUS SUBSTANCES IN DICALCIUM PHOSPHATE, LIMESTONE AND BOVINE BONE MEAL USED IN BRAZILIAN LIVESTOCK: DIOXINS, FURANS, BIPHENYLS, ARSENIC, THORIUM, URANIUM

A. Canella Avelar[1], W. Motta Ferreira[1], E. Abad Holgado[2], J. Parera[2], M. Menezes[3]

[1]Department of Animal Sciences, University Federal of Minas Gerais, Belo Horizonte, Brazil
[2]Laboratory of Dioxins Dpt. of Environmental Chemistry, IDÆA-CSIC, Barcelona, Spain
[3]Reactor and Irradiation Service, Nuclear Development Centre, Brazilian Nuclear Energy Commission, CDTN/CNEN, Belo Horizonte, Brazil

Background and Objetives: Phosphorus (P) deficiency in crops is an important constraining factor in plant and animal yields, especially in hot humid tropics where soils are predominantly acidic and often extremely P deficient with high P fixation capacities. Phosphates are used as P source (and calcium in some cases) in agricultural activities. About 90% of world production is utilized by the fertilizer industry to manufacture fertilizers and soil amendments, with the remainder being used to manufacture of animal feeds, detergents and chemicals. We aimed to obtain data on several contaminants (persistent organic pollutants like dioxins, furans, and biphenyls, assessing their main congeners, as well as, arsenic, thorium and uranium) in dicalcium phosphate, limestone and calcinated bovine bone meal - mineral feed additives.

Methods: Two different approaches were undertaken: High-Resolution Gas Chromatography coupled to High-Resolution Mass Spectrometry (HRGC-HRMS) to monitor feed materials that could be considered sources of contamination of the food chain, and Instrumental Neutron Activation Analysis (INAA) to assess the toxic elements in these feed products.

Results: All of the selected contaminants were detected in the studied products. In particular, PCB 126 in the dicalcium phosphate was four times higher than in the limestone and the bovine bone meal. Arsenic in the limestone was three times higher than the concentration observed in earth's crust.

Conclusions: Since no one of the substances studied herein are considered essential in man and animal lives, precautionary measures should be taken to eliminate or at least, to minimize the presence of these contaminants in any product used in the human food chain.

Key words: arsenic; biphenyls; dioxins; furans; uranium; thorium. Acknowledgements: This project is supported by FAPEMIG, CNPq (Brazil) and CSIC (Spain).

PO3154

CONTAMINATION BY INDUSTRIAL EFFLUENTS ON SOIL WATER & PLANT & SYSTEMS IN UTTAR PRADESH INDIA

S. Sachan[1], S. Singh[2]

[1]G.B.Pant University of Agriculture & Technology, Tehri Garhwal, India
[2]Div of Soil Science& AgricultureChemistry, Institute of AgricultureScience, Banaras Hindu University, Uttar Pradesh India

Background and Objetives: The study was conducted in the Moradabad District of the State of Uttar Pradesh (India) to assess the effect of Industrial effluents that flow into the Karulla Drain that irrigates the farmer's fields, with the objectives to: 1. Characterise the quality of effluents for irrigation; 2. Study the long term effect on buildup of heavy metals in soil –water – plant systems of the area.

Methods: Sites using effluents as a source of irrigation were selected. Contamination level by industrial effluents on soil, plant & water systems was analysed. Season wise effluent, soil, plant and hand pump water samples were collected and analysed for different relevant chemical parameters.

Results: The magnesium content exceeded the tolerance limits for drinking water. The manganese and iron levels were above the maximum desirable limits for drinking water, so were lead, cadmium and chromium limits. Chloride content was high and pH of some samples ranged beyond the range prescribed for drinking water. The potassium and phosphorous levels were also high. In cereals zinc, manganese and iron were highest. In fruits lower concentration of toxic heavy metals were observed.

Conclusions: Metals rich effluents being discharged from various industries of Moradabad are not suitable for irrigation. There should be reconsideration as frequent use of effluents for irrigation leads to accumulation of heavy metals in soil beyond permissible limits. Ground water contaminants by trace metals may cause health problems. Effluent irrigation leads to bio accumulation of toxic metals which may prove hazardous for animal and human health.

Key words: Industrial effluents, heavy metals, health hazard.

PO3155

PHYSICOCHEMICAL AND SENSORY ANALYSIS OF SWEET BREADS MADE WITH BUCKWHEAT AND FRUIT FLOURS

V. Oliveira[1], C. Moller[2], R. Thoen[2], A. Rios[3], E. Amorim[2]

[1]Nutrition course, Department of Internal Medicine, Universidade Federal do Rio Grande do Sul (UFRGS), Ramiro Barcelos, Porto Alegre, RS, Brasil
[2]Nutrition course, Universidade Federal do Rio Grande do Sul (UFRGS), Porto Alegre, RS, Brasil
[3]Institute of Food Science and Technology (ICTA), Universidade Federal do Rio Grande do Sul (UFRGS), Porto Alegre, RS, Brasil

Background and Objectives: Each day more people become aware of coeliac disease, it is important to increase gluten free products. This work aimed to evaluate the physicochemical and sensory characteristics of sweet breads.

Methods: The sweet breads were made using buckwheat flour with passion fruit, apple or banana flour, instead of wheat flour, resulting in three different samples. It was also analyzed a traded sweet bread as standard. The physical analyses were made by weighting raw and baked samples and measuring the breads depth. The chemical analysis included moisture, ash, fat and protein content. The sensory analysis was taken with 36 non-trained, non-coeliac people who evaluated global acceptance, appearance, color, taste and texture, using both the hedonic scale (9 points) and the purchase intention scale (5 points).

Results: The raw and baked samples with buckwheat and passion fruit flour were the heaviest ($p<0.05$). The depth analysis of the raw sample suggests that the passion fruit flour also obtained more volume (3.0 cm) and the baked analysis still shows the passion fruit flour sample in front (4.5 cm). The baking time also showed significant statistic difference among the breads ($p<0.05$): 72 minutes for passion fruit, 64 minutes for the apple and 60 minutes for the banana. It was noticed that the passion fruit bread had more moisture (46.5%), with significant difference among the other samples ($p<0.05$). The highest ash percentage was found in the banana bread (1.1%), as well as fat content (11.3%). The standard sweet bread had the highest protein value (2.18%). The apple bread had the best score in appearance (7.5) and color (7.3). Taste result suggested that the standard sweet bread would have better acceptance (7.5) while texture test pointed the banana bread as the best (7.1).

Conclusions: The breads showed good batter growth, good taste, and overall acceptability.

Key words: Buckwheat, gluten, coeliac disease.

PO3156

PHYSICOCHEMICAL AND SENSORY EVALUATION OF GLUTEN-FREE COOKIES MADE WITH RICE FLOUR, RICE BRAN AND SOY FLOUR

V. Oliveira[1], M. Mariani[2], E. Vogt[3], J. Venzke[2]

[1]Nutrition course, Department of Internal Medicine, Universidade Federal do Rio Grande do Sul (UFRGS), Ramiro Barcelos, Porto Alegre, RS, Brazil
[2]Nutrition course, Universidade Federal do Rio Grande do Sul (UFRGS), Brazil
[3]institute of Food Science and Technology (ICTA), Universidade Federal do Rio Grande do Sul (UFRGS), Brazil
[4]Nutrition course, Universidade Federal do Rio Grande do Sul (UFRGS), Brazil

Background and objectives: Coeliac disease, also called gluten-sensitive enteropathy, is characterized by chronic inflammation with abdominal pain and diarrhea, malabsorption, and nutrient deficiencies. The treatment consists of permanent withdrawal of gluten from the diet. As variety in the diet is important to avoid monotony, the objective of this work was to evaluate the physical, chemical and sensory properties of gluten-free cookies, made with rice flour, rice bran and soy flour.

Methods: Four formulations were made: TP- standard (wheat); T1- rice flour (50%) and soybean (50%); T2- rice bran (50%) and soy flour (50%); T3- rice flour (33%) and soybean (33%) and rice bran (33%). The following physical parameters were evaluated: weight loss after cooking, diameter and thickness after cooking, and expansion factor. The chemical composition was evaluated analyzing the moisture, protein, fat, ash, dietary fiber and carbohydrates content. In the sensory analysis, it was evaluated the acceptability through the attributes of appearance, color, texture, flavor and overall acceptance and purchase intent.

Results: Regarding the physical parameters, T3 had statistically significant results in the increase of diameter and expansion factor. For chemical analysis, T2 values were statistically significant in the protein content and dietary fiber. Regarding acceptability, the alternative treatments did not differ from standard. T3 had a higher percentage of intent to purchase.

Conclusions: Therefore, one can infer that the rice flour associated to soybean and rice bran is presented as a good alternative to make cookies for patients with coeliac disease.

PO3157

SELECTED ASPECTS OF FOOD SAFETY EVALUATION IN HOSPITAL CATERING IN POLAND

E. Konecka-Matyjek[1], M. Jarosz[2]

[1]Department of Food and Food Supplements, The National Food and Nutrition Institute, Warsaw, Poland
[2]Department of Dietetic and Nutrition in Hospitals with Clinic of Metabolic Diseases and Gastroenterology, The National Food and Nutrition Institute, Warsaw, Poland

Background and Objectives: Ensuring safety of meals served in hospitals is a priority regarding ilness-prone patients with compromised immune systems. The aim of the study was to evaluate the compliance with hygiene rules of hospital food production and processing areas.

Methods: The study was performed in 4 hospital food production areas located in central Poland. The assessment of compliance with hygiene rules was conducted in a food handling areas using audit technique in accordance with the international standard ISO 19011:2003. Additionally, a microbiological assessment of food-contact surfaces and employees' hands for hygiene indicator micro-organisms known as Total Viable Count (TVC) was done in accordance with ISO standards: ISO 18593:2004 and EN ISO 4833:2003.

Results: 8 audits including 114 interviews were done and 193 microbiological samples were collected and examined. The study has revealed that although the companies had a well-prepared hygienic documentation including plans of hygiene, they did not put them into practice. A microbiological study revealed that processes of cleaning and disinfection of food contact surfaces as well as employees' hands were often ineffective (31.1% of samples disqualified). The employees of the companies in question were knowledgeable in the field of food and personal hygiene but did not respect the procedures. The study confirmed the results obtained in a recently published Polish national monitoring survey on microbial contamination of hospital food-contact surfaces, where 25.5% of microbiological samples were disqualified.

Conclusions: The food hygiene in surveyed hospitals was not satisfactory. Motivating food handling trainings for stuff are essential for a better understanding of hygiene procedures and their implementation methods. Strict internal controls, and frequent official food controls are highly recommended.

Key words: Hospital, food hygiene, food handling area.

PO3158

EVALUATION OF QUALITY OF NUTRITION IN POLISH HOSPITALS

E. Konecka-Matyjek[1], M. Jarosz[2]

[1]Department of Food and Food Supplements, The National Food and Nutrition Institute, Warsaw, Poland

[2]Department of Dietetic and Nutrition in Hospitals with Clinic of Metabolic Diseases and Gastroenterology, The National Food and Nutrition Institute, Warsaw, Poland

Background and Objectives: A rational, balanced nutrition of hospitalized patients is a very important element supporting the treatment. It influences the recovery of patients, increases the effectiveness of treatment and reduces the risk of complications. Proper nutrition reduces time of hospitalization and the costs of treatment. The aim of the study was to analyse, interpret and evaluate the data on nutrition provided to patients in hospitals in Poland.

Methods: The official food control unpublished results, presented in statistical forms, referring to quality of nutrition in Polish hospitals in 2011 were used, converted, analysed and interpreted according to the Polish dietary reference intakes.

Results: Out of 222 samples taken for theoretical (qualitative, quantitative) testing, 37.8% were inconsistent with the Polish standards. Analysis revealed inconsistency both in single (33.2%) and decade menus (63.8%) in respect of energy content (20.0%), proportion of energy from protein (22.2%), as well as from fats (37.8%), unbalanced diet in terms of calcium (63.2%), iron (71.1%) and vitamin C (63.2%). Out of 27 samples of meals taken for laboratory testing, 55.6% were disqualified in respect of energy content (51.2%), proportion of energy from protein (7.4%) and from fats (29.6%). The analysis confirm results of a previous study conducted by the Polish Supreme Chamber of Control in 2008.

Conclusions: The study shows that quality of nutrition in respect of balanced diet provided to patients in hospitals in Poland is unsatisfactory. It might result in malnutrition, especially among patients staying in hospitals for a long time and not being supplied with outside foodstuffs by visitors. The educational activity for hospital caterers should be conducted. There is a need to continue a monitoring study on this subject.

Key words: Hospital, quality of nutrition, dietary reference intakes.

PO3159

KITCHEN STAFF'S KNOWLEDGE OF HAND HYGIENE IN ANKARA/TURKEY

I. Turan[2], A. Uçar[1], F P. Çakiroglu[1]

[1]Department of Nutrition and Dietetics, Faculty of Health Sciences, University of Ankara, Turkey

[2]School of Home Economics, University of Ankara, Turkey

Background and Objectives: Washing hands, which is the first step of personal hygiene, is considered as the primer method to control the spreading of infectious diseases. This study aims to identify the knowledge about hand hygiene of the staff who works in an industrial kitchen.

Methods: The study was conducted with 300 subjects who work in the cafeterias and kitchens of 4 different govermental institutions in Ankara. A questionnaire containing 38 statements has used to determine the knowledge of hand hygiene (Alpha =0.947). Total hand hygiene scores were calculated giving "1" point for each correct answer and "0" point for each incorrect answer. Subjects who scored >23 points were classified as having "sufficient knowledge", and subjects who scored <23 points classified as having "insufficient knowledge". Data evaluation was made using SPSS program.

Results: 92.0% of the participants were male, 52.0% of them were high school graduates. 41.0% of them had been performing their business for 20-31 years and 42.0% of them had been performing their business for 1-10 years. 57.0% of the participants had sufficient knowledge and the mean score of knowledge was 23.08+10.63. The mean score was not found statistically significant according to age, gender and working years.

Conclusions: One of the easiest ways of spreading the bacteria starts with food processer's hands. Therefore staff should be educated about hygiene procedures, education about hand hygiene should be considered important and the staff must have hygienic hand washing habits.

Key words: Hand hygiene, Hygiene Knowledge, Kitchen staff, food safey, Turkey.

PO3160

THE RESULTS OF SENSUALITY EXAMINATION OF THE COMMERCIAL DISASTER FOOD

N. Katayama[1], K. Sagara[2], H. Matufuji[3]

[1]Nagoya Women's University, Aichi, Japan
[2]Kanazawa gakuen college, Kanazawa, Sanjamachi, Japan
[3]Jyunshin colledge, Hakusan, Japan

Background and purpose: Development of the disaster food which can store for a long term is urgent business. However, we have to think about the mental for the people, first. Delicious disaster food is very important for the people to keep their appetite. We have to think about not only nutrition but also taste in the disaster food. Therefore in this study, we examined sensuality of the commercially food which can keep for a long term. And based on the result, we thought about the taste and smell in future disaster foods.

Methods: Thirty eight female college students (20-21 years old), they eat some commercially available rice things (eight kinds) which can store for five years.And we performed to do sensuality examination for them. Students carried out the sensory examination and scoring (Perfect score is 10) of food. The marketing products are cooked with cold water in 60 minutes. "vegetable rice", "shrimp pilaff", "perilla and seaweed rice", "chirashi-sushi", "white rice" "fried rice", " beef rice" and "dry curry ", of the magic rice (product made in Satake Corporation) .

Results: An evaluation was high in the taste in order of "chirashi-sushi", "vegetable rice", "shrimp pilaff", "dry curry", "fried rice", "perill and,seaweed rice", "beef rice" and "white rice". As for the highest score was 8.8±1.2, the low lowest score was 7.0±1.5.

Conclusion: As for both the taste and the smell, "chirashi-sushi" " dry curry " "beef rice" occupied the high rank. It is affected that this subject was a student in its twenties. We need to do this sensuality examination for many different kind of peoples. We would like to make delicious universal disaster food to use different kind of spices for help the victim.

Key words: Universal disaster food, delicious, sensuality examination, water cooking.

PO3161

MAPPING PRIORITIES FOR PROMOTING FOOD SAFETY IN INDIAN HOUSEHOLDS THROUGH DEVELOPMENT AND VALIDATION OF INTEGRATED SCORES BASED ON KEY DETERMINANTS

S R. Vemula[1], S. Gauravarapu[2], V V R. Mendu[3], S. Battiprolu[4], K. Polasa[5]

[1]Food and Durg Toxicoligy Research Centre, National Institute of Nutrition, Hyderabad, Andhra Pradesh, India
[2]Extension and Training Division, National Institute of Nutrition, Hyderabad, Andhra Pradesh, India
[3]Biostatistics, National Institute of Nutrition, Hyderabad, Andhra Pradesh, India
[4]Former Director, National Institute of Nutrition, Hyderabad, Andhra Pradesh, India
[5]Director-in-charge & Head Food & Drug Toxicology Research Centre, National Institute of Nutrition, Hyderabad, Andhra Pradesh, India

Background and Objetives: Mortality and morbidity are high among children (< 5yr) in India and 20% of them are attributable to diarrhoea. Therefore, food safety assumes national priority. Promoting food safety at household level, especially among food preparers (mothers) needs thorough understanding of three basic indicators - awareness, practices and enabling assets (like potable water, clean fuel). There is a need to assess the current scenario on these indicators to set goals and monitor progress in measurable terms at national and regional levels. We aim to develop weighted scores for awareness, practices and enabling assets and an integrated food safety index combining these.

Methods: Data on food safety awareness, practices and enabling assets were collected from a stratified random sample of 20,719 mothers from 28 states, 5 regions of India, by administering pre-tested questionnaire. Responses to 48 questions -awareness (19), practices (10) and enabling assets (19)- were given weightages. These were combined to arrive at integrated foodsafety scores, which were validated with prevalence rates of diarrhoea in different states. The states were grouped into tertiles -high, medium and low performers- based on these scores. Multiple logistic regression was applied to identify relative risks.

Results: Maximum possible scores on enabling assets, awareness and practices were 45, 14 and 47, respectively, and integrated-score was 106. Mean integrated-score at national level was 36.3, with minimum (30.3) in Eastern India and maximum (43.0) in Northeast. Food safety practices were better compared to awareness at national level. The relative risk of getting foodborne illness if stored food was consumed the next day was 2.3 times, while the odds for type of fuel were 1.6 times.

Conclusion: The integrated-scores developed in this study could be useful to assess, monitor and develop appropriate strategies to promote food safety at household level.

Key words: Food-safety, Knowledge, Practice, Integrated-score.

PO3162

DEVELOPMENT AND EVALUATION OF AMARANTH GRAIN BASED COMPLEMENTARY FOODS SUPPLEMENTED WITH EDIBLE TERMITES AND DAGAA FISH

J N. Kinyuru[1], S O. Konyole[2], S A. Onyango-Omollo[2], G M. Kenji[1], C A. Onyango[1], V O. Owino[3], B O. Owuor[4], B B. Estambale[2], H. Friis[5], N. Roos[5]

[1]Jomo Kenyatta University of Agriculture & Technology, Nairobi, Kenya
[2]University of Nairobi, Nairobi, Kenya
[3]Winfood Project, University of Nairobi, Nairobi,Kenya
[4]Catholic University of East Africa, Nairobi, Kenya
[5]University of Copenhagen, Copenhagen, Denamrk

Background and Objectives: Availability of low-cost, nutrient dense complementary foods is a major challenge to child nutrition in developing countries. The aim of this research was to optimize a process for production of nutrient dense, acceptable, safe and low cost cereal based complementary foods supplemented with animal source foods.

Methods: Processes to reduce phytic acid in amaranth grain and microbial contamination in termites and fish were optimized. Four extruded complementary foods (CF4, CF5, CF6 and CFC) composed of germinated amaranth grain, maize, edible termites, dagaa fish were then formulated and processed to pre-cooked flour.

Results: CF4 contained 429.42 kcal/100g energy, 17.86 g/100g protein, 9.27 g/100g fat, 20.71 mg/100g iron, 5.96 mg/100g zinc; CF5 contained 436.02 kcal/100g energy, 17.55 g/100g protein, 9.75 g/100g fat, 23.94 mg/100g iron, 4.87 mg/100g zinc; CF6 contained 442.40 kcal/100g energy, 19.00 g/100g protein, 9.10.42 g/100g fat, 27.41 mg/100g iron, 4.22 mg/100g zinc; CFC contained 396.00 kcal/100g energy, 13.72 g/100g protein, 7.07 g/100g fat, 2.63 mg/100g iron, 4.19 mg/100g zinc. CF5 was the most preferred by consumers and none of the foods showed signs of microbial or aflatoxin contamination. Estimated costs of the foods were within affordable rates from a Kenyan perspective (USD 1.82 – 3.76).

Conclusions: Therefore, the ingredients can be effectively used to develop low cost complementary foods with adequate nutrient density and consumer acceptance.

Key words: Child nutrition, Nutrient density, Consumer acceptance, Low-cost.

PO3163

SWEETPOTATO-MANGO LEATHER – AN ALTERNATIVE HEALTHY SNACK

L. Effah-Manu[1], I. Oduro[1], A. Addo[1]

[1]Kwame Nkrumah University of Science and Technology, Department of Food Science and Technology, Kumasi, Ghana

Background and Objectives: The highly perishable nature of mangoes and sweetpotatoes due to high moisture content, results in high postharvest losses; thus there is a need to process them into more stable products. Dextrinized sweetpotato was therefore added to mangoes to produce fruit leathers. The effect of dextrinized sweetpotatoes on physicochemical and sensory quality of sweetpotato-mango leather was studied.

Methods: Sweetpotatoes were dextrinized in an oven at different temperatures (150-200 oC) and time (2, 2.5 and 3.0 h) for optimization using completely randomized design. The amount of dextrins formed and dextrose equivalents were determined. The physico-chemical parameters (pH, acidity, water activity and vitamin C) of the pulp and leathers are reported in this study. Consumer acceptability test was also conducted.

Results: The optimal temperature for maximum dextrin of 19.41 was 190-200 oC. Water activity and pH ranged from 0.61-0.63 and 4.2-4.33, respectively, and vitamin C increased with the addition of sweetpotato. The overall acceptability was high (1.58-1.63) but non- significant ($p < 0.05$) with the amount of sweetpotato added. The mouthfeel was disliked slightly (4.06-4.40) by panellists but colour, smell and taste were rated high (1.00-1.97) due to product aesthetic appeal, fruitiness and sweetness.

Conclusions: The physico-chemical and sensory values obtained for infra-red dried sweetpotato-mango leather indicate that sweetpotatoes could be a good source binding and 'sweetening' agent in fruit leather production without deteriorating quality parameters. Dextrinization of sweetpotatoes could be considered as an excellent alternative in food applications like fruit leathers production; thus providing alternative products for health conscious consumers.

Key words: Dextrinization, mango, physico-chemical, sensory, sweetpotatoes.

PO3164

A CROSS-SECTIONAL STUDY ON THE ASSOCIATION BETWEEN FOOD CONSUMPTION AND URINARY AFLATOXIN M1

M R. Sabran[1], R. Jamaluddin[1], M S. Abdul Mutalib[1], N A. Abdul Rahman[1]

[1]Department of Nutrition and Dietetics, Faculty of Medicine and Health Sciences, Universiti Putra Malaysia, Serdang, Selangor, Malaysia

Background and Objectives: Aflatoxin B1 (AFB1) is a potent hepatocarcinogenic mycotoxin, found ubiquitously in the foodstuffs. Human exposure to aflatoxin led to the CYP450-mediated biotransformation of AFB1 into different metabolites, where some are excreted in the urine. Aflatoxin M1 (AFM1) is a metabolite of AFB1 and detection in the urine is associated with the dietary AFB1 exposure. This study aimed to detect the levels of urinary AFM1 and to find its association with food consumptions.

Methods: Morning urine samples were collected from one hundred-sixty adults (n=160) for the analysis of AFM1 using ELISA. Additionally, respondents' food consumptions from 4 groups, namely cereals and legumes, nuts and nutty products, milk and dairy products and spices and herbs were assessed through a semi-quantitative food frequency questionnaire. The urinary AFM1 levels were expressed as pg/g Cr (Creatinine) to correct variation in urine dilution.

Results: 67.3% (n=66) of 98 positive samples had AFM1 level above limit of detection [Mean ± SEM=2.065 ± 0.209 pg/g Cr, Median=1.53 pg/g Cr]. The median total intakes of cereals and legumes, nuts and nutty products, milk and dairy products and spices and herb were 759, 11.68, 67.79 and 9.16 g/day respectively. A significant association was only found between the intake of milk and dairy products and urinary AFM1 levels. Indeed, the chi-square test showed relationship among respondents with urinary AFM1 level greater than 1.53 pg/g Cr and consumed milk and dairy products more than 67.79 g/day (R^2=8.030, p=0.005), with the odd ratio (OR) of 3.275 (95% CI=1.422-7.459).

Conclusion: The causal effect on the occurrence of AFM1 in the urine due to consumption of milk and dairy products could not be postulated. Nevertheless, the findings provide valuable reference for further investigations to find potential causes and consequences of food-borne aflatoxin exposure in Malaysia.

Key words: Aflatoxin, aflatoxin M1, food consumptions, Malaysia.

PO3165

RESULTS OF MONITORING FOR THE GLYPHOSATE TOLERANCE GENE IN SOYBEAN CURDS DISTRIBUTED AT MATSUMOTO-CITY

N. Okishima[1]

[1]Faculty of Human Health Science, Matsumoto University, Matsumoto, Japan

Background and Objectives: In Japan, many consumers' fear gene modified organisms (GMOs) although they don't know the advantages and disadvantage of GMOs, nor understand the technology involved. In addition, many Japanese don't know that within 5 % of contamination of GMOs in agricultural products is considered "unintended contamination" which allows such products to be labeled "Non-GMO" if they had been treated under identity preserved (IP) handling. Soy bean curds not exceeding 5% contamination of the glyphosate tolerance (RRS) gene were in fact observed in some areas around Japan. However no evidence of RRS contamination in Soybean curds distributed at Nagano Prefecture was found. In light of this evidence, RRS content rates were examined mostly Kinugoshi-tofu (soft and smooth soybean curds) sold in the Matsumoto area between May of 2011 and April of 2012.

Methods: Genome DNA and RRS genes were extracted from tofu using the silica-based membrane methods, and were arranged for the isolation DNA from it. RRS and internal control gene Le1 were measured by realtime PCR-system, using standard curve methods. The content rate were calculated on the official methods.

Results: 102 samples of soybean curds were examined for RRS content rates. The data showed the content rate was varied between 0.00 to 0.31 %, and 44 samples (43.1% out of 102 samples) contained RRS. All of RRS contents were trace amount, however, it was lower than 5% of the Consumer Affairs Agency's guideline.

Conclusion: These and other data from around Japan suggested that the limitation of the GMOs mix determining the "Non-GMO" label may possibly be decreased to the EU level of around 0.9 %.

Key words: GMOs, RRS, Soybean curds.

PO3166

OXIDATIVE MODIFICATION OF PROTEINS-DIET INDUCED GUT OXIDATIVE STRESS AND MICROBIOTA DYSBIOSIS IN MICE

G. Le[1,2], Y. Qiao[2], Y. Shi[1,2], J . Sun[1,2], X . Tan[1,2], C. Qi[3], H. Jiang[3], L. Hu[4]

[1]The State Key Laboratory of Food Science and Technology, JiangNan University, Wuxi, China
[2]Institute of Food Nutrition and Functional Factor, School of Food Science and Technology, JiangNan University, Wuxi, China
[3]COFCO Eastocean Oils and Grains Industries (Zhangjiagang) Co., Ltd., Zhangjiagang, China
[4]COFCO Rice (Wuchang) Limited,Wuchang, China

Background and Objectives: Oxidized protein had lowed digestibility and might enter colon in great amount and induce adverse effect on gut bacteria flora. In this study, we prove the hypothesis that oxidative modification of proteins-diet may influence gut microbiota directly and/or indirectly by carbonyl content and changing the redox state.

Methods: After long-term feeding of casein oxidized by HClO or MDA, oxidative damage indicators of colon and colonic content, including reactive oxygen species (ROS), total antioxidant capacity (T-AOC), malondialdehyde (MDA), and carbonyl content were analyzed. Plate count was employed for the quantitative analysis of Escherichia coli, lactobacilli, and enterococcus.

Results: ROS, MDA and carbonyl content significantly increased in both HClO and MDA oxidized casein fed mice ($p<0.05$), while T-AOC significantly decreased compared with control ($p<0.05$). HClO and MDA oxidized casein led to a 1.3-fold and 1.1-fold increase in E. coli quantity, a 1.5-fold and 1.3-fold increase in enterococcus, whereas lactobacilli were reduced by 1.3-fold and 1.1-fold, respectively. Carbonyl content of modified protein showed a strong positive association with E. coli and enterococcus ($p<0.05$), and a negative association with lactobacilli ($p<0.05$). The T-AOC of colon showed a high positive association with lactobacilli ($p<0.05$) and a negative correlation with E. coli and enterococcus.

Conclusions: Oxidative modification of protein has a dominating role in shaping gut microbiota and changes of some key populations, at least in part, through an effect on the level of oxidative stress.

Key words: Gut microbiota, Oxidative stress, oxidative modification of proteins.

Acknowledgments: The study was supported by the 12th 5-Year Plan for Science and Technology Development (No.2012BAD33B05), China.

PO3167

CONSUMPTION PATTERN, NUTRIENT COMPOSITION AND POTENTIAL HEALTH RISKS ASSOCIATED WITH ENERGY DRINKS CONSUMPTION BY UNIVERSITY OF IBADAN STUDENTS

O. Adepoju[1], V. Ojo[1]

[1]University of Ibadan, Ibadan, Nigeria

Background and Objectives: Fluids are vital requirement for humans and can be obtained from sources other than water. Selection of appropriate fluids and timing of intake are important for optimal health, especially in young people. Although energy drinks are mainly targeted to young adult consumers, little is known about the reasons for and consumption pattern, nutrient composition, and potential health risks of energy drinks in Nigeria. This study was carried out to determine the nutrient composition and assess pattern, frequency, reasons for and prevalence of adverse effects on consuming energy drinks among University of Ibadan students.

Methods: A cross-sectional survey of energy drink consumption was conducted among 307 Undergraduate and Postgraduate students living within the residence halls at the University, using a validated semi-structured questionnaire. Nutrient composition and physico-chemical properties of four commonly consumed energy drinks among students were determined using AOAC methods.

Results: Mean age of respondents was 23.05±4.57years, 79.2% were undergraduates and 51.1% were females. Majority (74.6%) have ever taken energy drinks prior to the study and 42.4% reported consuming at least one can in a week. About half (48.2%) indicated taking the drinks for increasing energy. Only 12.6% of respondents experienced side effects, of which 14% reported insomnia over short term consumption, and 12.2% frequent urination over long term consumption. Significant association was found between gender and frequency of consumption. Results of analyses showed that 100ml of energy drinks contained between 7.77-7.89g glucose, 22.61-23.74g fructose, 0.11-0.28g ash, 1.59-2.50mg vitamin B5, 1.57-2.64mg B6, 1.71-2.02µg B12, 24.19-28.76mg caffeine, 7.57-8.28 total acidity, 7.57-11.42g total solid, 3.36-3.81 pH, and yielded 43.59-48.89kcal gross energy.

Conclusion: Few respondents know about the potential health risks of energy drinks consumption. There is need for nutrition education on the risk potential of energy drinks consumption over time.

Key words: Energy drinks, Consumption pattern, Health risks, Nutrient composition.

PO3168

BIOACCESSIBILITY OF POLYPHENOLS AND ANTIOXIDANT CAPACITY IN FRUITS AND VEGETABLES: IN VITRO ENZYMATIC EVALUATION

R. Álvarez[1], H. Araya[1]

[1]Department of Nutrition, Faculty of Medicine, University of Chile, Chile

Background and Objective: Polyphenols are the most abundant dietary antioxidants and it has been demonstrated that they have numerous biological activities associated with decreased risk of chronic noncommunicable diseases (NCD). Food considered has a good source of polyphenols must have a high concentration of this compounds and also a high bioavailability, being bioaccessibility one of the most important factor to regulate it. The objective of this study was to evaluate total bioaccessible polyphenols and antioxidant capacity using an enzymatic extraction and then comparing these results with those obtained using a methanolic extract.

Methods: Concentration of polyphenols and antioxidant capacity were determined through the methods of Folin - Ciocalteu and FRAP respectively.

Results: It was observed that concentration of polyphenols from matrix food was significantly different (p 0.05) between enzimatic treatment (mean: 310.3 mg EAG/100g fresh sample) and methanolic extract (mean: 231.8 mg EAG/100g fresh sample). Antioxidant capacity showed significant difference (p 0.05) between both methods (mean: 1.91 mmol Fe/100g fresh sample and 1.46 mmol Fe/100g fresh sample, respectively). It was also demonstrated a significant correlation ($R^2 > 0.7$) between polyphenols concentration and antioxidant capacity in both extracts.

Conclusions: The research demonstrated that in vegetables the release of polyphenols and antioxidant capacity from matrix food was significantly higher in enzymatic method than that observed by methanol extraction. Our findings contribute to the understanding of the extraction of polyphenols using enzymatic extraction and then to obtain an approximation to bioaccessible compounds released from a food matrix.

Key words: Polyphenols, Antioxidant capacity, Enzimatic extraction, Bioaccessibility, Food matrix.

PO3169

ECO-NUTRITION – HOW ORGANIC PRODUCTION CONTRIBUTES TO HUMAN HEALTH DETERMINANTS

C. Strassner[1], J. Kahl[2], S. Bügel[3]

[1]Department of Home Economics Nutrition Science & Facility Management, University of Applied Sciences Muenster, Muenster, Germany
[2]Department Organic Food Quality and Food Culture, University of Kassel, Witzenhausen, Germany
[3]Department of Nutrition Exercise and Sports, University of Copenhagen, Frederiksberg, Denmark

Background and Objectives: Recently growing attention has been given to the question of the link between organic production methods and health effects in humans. However, these studies use an implicit model of health that is limited to an individual's physiological health. Indicators for human health or disease and/or dietary content of nutrients such as vitamins, minerals and fatty acids, as well as non-native compounds such as pesticide residues, heavy metals and other contaminants in foodstuffs have mainly been analysed. This poster introduces a multi-layered model of other, more social factors determining health status. It analyses and presents findings linking organic agriculture with further evidence-based health determinants.

Methods: Review of existing literature focusing on organic agricultural production, covering each of the determinants: education, work environment, unemployment, water and sanitation, health care services, housing.

Results: We found substantiation for one aspect of living and working conditions: organic farming practices reduce pesticide exposure to farm workers and their families. There is weak evidence linking gainful employment and organic production. Data could be found in support of the organic sector creating employment and also supporting local economies. Furthermore, research shows that it offers opportunities for self-employment and with it self-determination, offers reintegration into the job market, as well as identification and contentment. More rigorous research is needed here. A health determinant for which we found plentiful scientific evidence is water (not sanitation). Some governments actively promote organic agriculture as a means to improve local water quality.

Conclusions: The health determinants model allows exploring a bridge between organic agricultural production and health. There is some first evidence for a contribution of organic production to general socio-economic, cultural and environmental conditions influencing health.

Key words: Healthy living, health determinants, eco-nutrition, agro-ecological production.

PO3170

IDENTIFICATION OF A SILICON–OXIDE LEACHATE FROM A BAKEWARE SURFACE COMPRISING OF A TEREPHTHALATE POLYMERIC MATERIAL

H. McWhinney[1], S. McWhinney[2], T. Grady[1]

[1]Department of Chemistry, Prairie View A&M University, Texas, USA

[2]Department of Agriculture, Nutrition & Human Ecology, Prairie View A&M University, Texas, USA

Background and Objectives: The low surface energy properties of poly-tetra-fluoroethylene compounds (PTFEs), also known as Teflon, gave rise to its widespread and popular use as an anti-stick passivating coating on cooking utensils. Several questions have been raised regarding health issues related to the use of these materials. PFTE and other organic based coatings have been found unsuitable for commercial applications, because of their inability to withstand degradation at high temperatures. There are many unanswered questions related to leaching from these coatings during the cooking process. Coating materials exhibit complex chemistries which include, but are not limited to silicone based products, metal based surfaces and coatings, ceramic based coatings and a family of polymer and composites based on poly-terephthalates. This study utilized a surface characterization approach in the analysis of a commercially available bakeware in order to identify the composition of the coating material and also to investigate its leaching potential.

Methods: Cakes were baked at the regular temperature of 350 degree F for 25 minutes in a paper lined coated bakeware. The paper was analyzed prior to and after baking. Cutting edge characterization techniques (X-ray Photoelectron spectroscopy, ATR-Infrared spectroscopy, and X-ray fluorescence spectroscopy) were utilized in the analysis of the paper liner and bakeware coating material, in an effort to determine the composition of the coating and identify the presence of any leached material from the bakeware surface.

Results: The coating material was identified as a polyethylene terephthalate/silicon composite. It was also found that a silicon oxide (Si-O) compound leached from the coating into the baking paper under normal baking conditions.

Conclusions: This study indicated that chemical composition, leach potential and stability of cookware surfaces can be effectively delineated by a combination of modern surface characterization techniques.

Key words: Bakeware Silicon Surface Characterization Coating.

PO3171

THE QUALITY OF HIGH-PRESSURE-INDUCED AND HEAT-INDUCED LEMON MARMALADE

H. Kuwada[1], Y. Jibu[2], M. Tabuchi[2], A. Teramoto[3], Y. Kimura[1], K. Ishii[1], C. Takahashi[1],

S. Hiramatsu[1], M. Fuchigami[1]

[1]Department of Nutrition and Life Science, Fukuyama University, Fukuyama, Hiroshima, Japan

[2]Department of Nutritinal Science, Okayama Prefectural University, Soja, Okayama, Japan

[3]Department of Health and Nutrition, Kanto Gakuin University,Yokohama, Kanagawa, Japan

Background and Objectives: The objectives of this study are to establish a process for pressure-induced lemon marmalade, compare it with heat-induced marmalade, and investigate the softening of peel during soaking in citric acid, heating or pressurization.

Methods: The peel was sliced and soaked in citric acid solutions (pH 2.0, 2.2, 2.5 or 2.7) for 24 hrs, then changes in firmness were measured. Sliced flavedo was soaked at pH 2.0. The albedo, segment wall and juice sacs were homogenized with citric acid solution (pH 2.5). They were then mixed after soaking for 24 hrs. Sucrose was added (final sugar 55%), vacuum packed, then pressurized for 30 min at 500 MPa or boiled for 10 min, respectively. The firmness of flavedo and the rheology of marmalade were then measured and sensory evaluation was compared using a five point scale. Also, the amounts of pectin and naringin in four parts of lemon were measured. Changes in the texture and structures when soaked, pressurized or boiled were also measured.

Results: As the pH values were lower, the firmness of the peel decreased. Firmness of flavedo was (greatest to least); pressurized > heated > soaked at pH 2.0, respectively. The cell walls of flavedo and albedo did not loosen after pressurization. However, after soaking or heating, the middle lamella of albedo separated. The amount of pectin was greatest in albedo > flavedo > endocarp > juice sacs, respectively, while the amount of naringin was greatest in flavedo and albedo > endocarp > juice sacs. The peel of high-pressure-induced marmalade maintained a natural color and flavor. However, there is no great difference in viscosity between high-pressure-induced and heat-induced marmalade.

Conclusions: High-pressure-induced marmalade was evaluated as better than heat-induced marmalade when a sensory test was given.

Key words: Lemon, high pressure, marmalade, pectin, rheology.

PO3172

THE RELATIONSHIP BETWEEN PECTIC COMPOSITIONS OF DRIED STEM-LETTUCE (YAMA-KURAGE) AND DIFFICULTY IN COOKING

M. Fuchigami[1], H. Kuwada[1], K. Ishii[1], Y. Kimura[1], C. Takahashi[1], S. Hiramatsu[1], Y. Jibu[2], M. Tabuchi[2], A. Teramoto[3]

[1]Department of Nutrition and Life Science, Fukuyama University, Fukuyama, Hiroshima, Japan
[2]Department of Nutritional Science, Okayama Prefectural University, Soja, Okayama, Japan
[3]College of Human Environmental Studies, Kanto Gakuin University, Yokohama, Japan

Background and Objectives: The dried stem-lettuce is called Yama-kurage (mountain-jelly fish), because its texture is similar to salted jelly fish. When it is reconstituted by soaking in water then cooked, it maintains a crisp texture. Thus, the objective of this study is to investigate difficulty in cooking.

Methods: The stalks of stem-lettuce were pealed and divided lengthwise for both raw and dried samples. Both samples were cut into three segments (top, middle and bottom). The dried sample was soaked in water for 2 hrs. Changes in texture and structures when reconstituted or cooked for 20 min were measured. Also, pectin in these three segments was successively extracted as follows: water, 0.01N HCl, 0.1M sodium acetate buffer, 2% sodium hexametaphosphate and 0.05N HCl solutions. These extracts were designated as WSP, PA, PB, PC and PD, respectively.

Results: The firmness of raw and cooked segments was (greatest to least); bottom > middle > top segment, respectively. Dried segments were more difficult to soften during cooking than raw segments. When cooked, the middle lamella (rich in pectic substances) of parenchyma cells separated and the primary cell walls were looser in the top > middle > bottom segment, respectively. The amount of Water-Soluble-Pectin and PD was slight in all raw and reconstituted segments, but WSP increased when the raw stalk was cooked. The amount of PA (high-methoxyl-pectin) was greatest in both top and middle raw segments. Therefore, when cooked, pectin degraded by transelimination and dissolved in cooking water; consequently, they softened. However, in the bottom segment, PC (low-methoxyl-pectin) was greatest; therefore, it was difficult to soften. During drying and reconstitution, PA decreased while PB (low-methoxyl-pectin) increased.

Conclusions: The demethoxylation of pectin during drying inhibited the degradation of pectin during cooking. Thus, dried stem-lettuce was difficult to cook.

Key words: Stem-lettuce, pectin, drying, texture, structure.

PO3173

INFLUENCE OF SPICES ON THE FOOD INTAKE BY IMPROVING FLAVOR

K. Kubota[1], Y. Tanaka[1], Y. Iijima[2], Y. Kurobayashi[3]

[1]Department of Food and Nutritional Sciences, Graduate School of Humanities and Sciences, Ochanomizu University, Bunkyo, Japan
[2]Department of Nutrition and Life Science, Kanagawa Institute of Technology, Kanagawa, Japan
[3]Technical Research Institute, R & D Center, T. Hasegawa Co., Ltd., Kanagawa, Japan

Background and Objectives: Spices have been used for medical purposes and recently are considered as functional food because of their contribution to food science, such as taste and aroma. Japan is an aging society and there are a lot of undernourished people due to inadequate food intake either due to lack of appetite or other reasons. It is necessary to improve food taste to increase food intake and spices could play an important role in the improvement of food taste to enhance appetite. This study aimed to investigate the influence of spices on dishes, focusing on interaction between the flavor of spices and taste of dishes.

Methods: Eleven kinds of commercial spices obtained in local Japanese market were used. Aroma extract was prepared by steam distillation. Chicken broth made of chicken bones was prepared in the laboratory. Flavor extracts of spices were added to broth and subjected to sensory evaluation. Eighteen statements were used to determine how spices influenced the taste of broth. Flavor was objectively analyzed using GC-MS-Olfactometry.

Results: Results indicated that all spices used in this study had its specific characteristic flavor which improved umami taste of soup and decreased unpleasant meaty and undesirable flavor, focusing on lemongrass and basil because they enhanced more the umami and savory taste. Addition of aroma extract of lemongrass and basil to chicken broth, scores for •thickness, mellowness, and •satisfaction• significantly increased . Moreover, addition of basil also increased scores for •clarity•, mildness, and •sweet taste• . Results of instrumental analyses suggested that some specific key compounds contributed to the enrichment of taste of the soup.

Conclusions: Some spices were effective in improving taste which helped improve appetite and prevented undernourishment in the elderly which could raise the quality of life.

Key words: Spices, aroma, flavor improvement.

PO3174

ASSESSMENT OF GREEN AND MONTMORILLONITE CLAYS AS POTENTIAL MYCOTOXIN ADSORBENTS IN HUMAN INTESTINAL CACO-2 CELLS

A. Anadón[1], M A. Martínez[1], I. Ares[1], E. Ramos[1], M. Martínez[1], V. Castellano[1], M R. Martínez-Larrañaga[1], A. Romero[1]

[1]Department of Toxicology and Pharmacology, Faculty of Veterinary Medicine, Universidad Complutense de Madrid, Madrid, Spain

Background and Objectives: High incidence rates of contamination by mycotoxins of cereal grains and animal feed have been reported worldwide. In order to avoid mycotoxicosis, several strategies have been investigated such as the use of adsorbents. The chemical affinity of some molecules for mycotoxins could allow a reduction of their bioavailability, decreasing intestinal absorption, blood concentration and distribution to target organs. The aim of the present research work is to evaluate a possible protector role of the Green and Montmorillonite clays as adsorbent against mycotoxins-induced cytotoxicity on Caco-2 cells.

Methods: Cytotoxicity was investigated by using seven different mycotoxins, deoxynivalenol, ochratoxin A, T2 toxin, fumonisin B1 and B2, aflatoxin B1 and B2 at increasing concentrations (1-100 μM). MTT assay was used to test cell viability in presence or not of Green and Montmorillonite clays (0.1 mg/ml).

Results: Following 24 h incubation with the seven mycotoxins tested, a statistically significant decrease of cell viability in a concentration dependent-manner was observed. Both clays at the concentration range of 1-0.01 mg/ml did not produce any statistically significant decrease on cell viability. After a 24 h co-incubation period with mycotoxins and both clays, Green clay at 0.1 mg/ml was more effective than Montmorillonite clay reducing the toxicity induced by mycotoxins in Caco-2 cells.

Conclusions: The present study allowed identifying the differential adsorption capacity of Green and Montmorillonite clays against the most important mycotoxins commonly found in cereals, related products and cereal components constituting an important part of human and animal food.

Key words: Mycotoxins adsorption, Cytotoxicity, Green clay, Montmorillonite clay, Caco-2 cells.

PO3175

OPINION POLL OF USERS WITH RESTRICTIVE DIETS AND FOOD SERVICE PROFESSIONALS. DESIGN OF TRAINING PROPOSALS FOR COMMERCIAL CATERING

M. Illan[1], X. Torrado[1], D. Zomeño[1], E. Roura[2], I. Lugo[3], A. Farran[1], E. Trias[4]

[1]Departament of Nutrition & Food Science, University of Barcelona, Campus de L'Alimentació Torribera, Santa Coloma de Gramenet, Barcelona, Spain
[2]Fundació Alicia, Mont Sant Benet, Spain
[3]CETT, Tourism & Hospitality Education Research, Barcelona, Barcelona, Spain
[4]HUBc, Health University of Barcelona, Barcelona, Spain

Background and Objectives: Multidisciplinary project aimed at commercial catering so as to facilitate the adaptation of their menus targeting the population with some type of food restriction, intolerance and allergy. The main objective is to understand the needs of these users when eating away from home and thus provide adequate tools to commercial catering establishments who wish to offer food products adapted to different diets.

Methods: After obtaining information on the current state of the issue, the pathologies to be considered were defined: celiac disease, lactose intolerance, food allergies and diabetes. Then an online web survey designed for each pathology was distributed to individuals having pathologies as well a food service professionals. In addition international contacts were made with universities in Argentina and Lebanon.

Results: 2583 individuals have participated in the survey. From the responses obtained, of those affected by food allergies, 92.9% believed that food service professionals responsible for customer service have little or no information on this topic. For those affected by diabetes, 53.2% believed that the information provided on menus was insufficient and 52.4% would like to have them include nutritional information. 81.5% of individuals having gluten intolerance found that dishes offered in food establishments lacked variety. 50.9% of those with lactose intolerance estimated that not one eating establishment within their usual environment offered options for their condition. 60% of food service professionals participating in the survey considered that it would be interesting to receive training on this topic and expressed that the main difficulty they encounter in implementing such diets is the lack of information.

Conclusions: The results observed show a clear need to provide specific training for food service professionals, thus facilitating their ability to respond to the social demand of population groups having food related medical conditions.

Key words: Commercial catering, food intolerance, training.

PO3176

HEAVY METAL ANALYSIS OF FRUIT JUICE AND SOFT DRINKS BOUGHT FROM RETAIL MARKET IN ACCRA, GHANA

H. Ofori[1], M. Owusu[1], G. Anyebuno[1]

[1]Food Chemistry Division, CSIR-Food Research Institute, Accra, Ghana

Background and Objectives: Fruit juice and soft drinks are the usual beverages used in most festivities and celebrations in Ghana. As a result of the soil, atmosphere, underground and surface water pollution, our foods and beverages are contaminated with heavy metals. Heavy metals contamination has become a matter of public health concern but this has not received much research attention in Ghana with regards to fruit juice and soft drinks contamination. In the present study, levels of Cu, Fe, Pb, and Zn in fruit juice bought from retail market in Accra, Ghana, were determined and values compared with WHO standards. Method: Twenty bottles comprising of fruit juice and soft drinks were bought from retail market in Accra between June-December 2012. The dry ash method was used in the analysis. Flame Atomic Absorption Spectrophotometer was used to determine the concentrations of the various metals in the samples.

Results: In the fruit juice sample analysed, the mean concentrations of trace metals determined were Cu, 0.83 mg/l; Fe, 9.07 mg/l; Pb, 1.59; Zn, 3.33 mg/l, whiles in soft drinks the mean concentration were Cu, 0.34 mg/l; Fe, 7.72; Pb, 0.72 mg/l; Zn, 1.07 mg/l. In fruit juice, concentration of metals were in the range Cu, 0.40-1.65 mg/l; Fe, 2.94-13.70 mg/l; Pb, 0.25-3.19 mg/l and Zn, 1.45-4.59 mg/l, whiles in soft drinks concentrations were in the range Cu, 0.29-0.46; Fe, 5.39-13.41 mg/l; Pb, 0.00-2.78 and Zn, 0.39-2.09.

Conclusion: Fruit juice and soft drinks bought from retail markets in Accra posed a health risk based on the concentration of heavy metals obtained. Lead posed the greatest risk as the level exceeded WHO safe limit.

Key words: Heavy metals, fruit juice, soft drinks.

PO3177

THE STUDY OF SPROUTS CULTIVATION USING THE SLIGHTLY ACIDIC ELECTROLYZED WATER PREPARED WITH HYDROCHLORIC ACID AS MATERIALS

K. Akiyama[1], T. Nakamura[2], M. Tomita[3]

[1]Depatment of Human Health and Design,Showa Women's University, Tokyo, Japan
[2]Morinaga Milk Industry Co.,LTD, Tokyo, Japan
[3]Dairy Tecno Inc., Tokyo, Japan

Considering the stable supply and the safety of vegetables, soilless growth is desirable. It is required to prevent contamination by the microbe in soilless growth. Therefore, we thought it effective to grow up using slightly acidic electrolyzed water equipped with strong sterilizing properties. Furthermore, it inspected whether it was what can be filled in the taste. Seeds were sterilized when seeds of lettuce were attached to slightly acidic electrolyzed water. The bactericidal effect was very high. There was no influence in a germination rate. The bean sprouts of the alfalfa cultivated with slightly acidic electrolyzed water had few bacteria. Furthermore, it was a taste equivalent to a commercial item. The sprouts of the Japanese radish cultivated with slightly acidic electrolyzed water did not grow. When we used having mixed tap water and slightly acidic electrolyzed water, the radish grew. Moreover, there were also few bacteria currently attached to radish sprouts. Furthermore, it was a taste equivalent to tap water cultivation radish sprouts. It is very useful to use slightly acidic electrolyzed water for hydroponic cultivation. 179 Research on the effect which used slightly acidic electrolyzed water for bean-sprouts cultivation.

IDENTIFICATION OF FRESH PLANT FOODS TO SUPPORT THE DEVELOPMENT OF A TOOL TO ASSESS FOOD BIODIVERSITY IN DIETARY SURVEYS

B. Gorgulho[1], J. Mercedes[1], D. Aliete[1], L S. Monteiro[2], T M. Vasconcelos[2], R. Pereira[2], R M. Fisberg[1], G. Kennedy[3], D H M. Bastos[1], D M. Marchioni[1]

[1]Universidade de São Paulo, São Paulo, Brazil
[2]Universidade Estadual do Rio de Janeiro, Rio de Janeiro, Brazil
[3]Food and Agriculture Organization, Rome, Italy

Background and Objectives: Biodiversity for food and agriculture includes the variety and variability of ecosystems, animals, plants and micro-organisms, at the genetic, species and ecosystem levels. The Food and Agriculture Organization

of the United Nations (FAO) states that understanding and enhancing the role of biodiversity is essential for food security and sustainable development. As a first step to develop a tool for accessing the food biodiversity in a health and dietary survey in the city of São Paulo (Brazil), we aimed to identify the fresh plant foods that most contributed for the intake of beta carotene, vitamin C and natural folate.

Methods: Data from a population-based survey included 2691 adolescents and adults. Food intake was measured using the Automated Multiple-Pass Method 24-h dietary recall and the nutrient contends using the USDA food table. Foods that contributed to beta carotene, vitamin C and natural folate intake were identified using the weighed-proportions formula developed by Block et al., (1985) which takes into account the number of respondents reporting the consumption of each food item, portion sizes, and nutrient content.

Results: After listing all food items that contributed for 100% of beta carotene, vitamin C and natural folate intake, the foods were separated into industrially processed foods and fresh food items. Next, fresh plant foods that contributed to the intake of each nutrient were identified. We found that: 96, 104 and 112 different fresh plant foods accounted for 24%, 19% and 17% of the total beta carotene, vitamin C and natural folate intake, respectively.

Conclusion: Few fresh plant food items contributed most to the intake of key nutrients. This work describes the process of reducing the list of foods to be detailed into varieties and to estimate the centesimal composition.

Key words: Biodiversity, plant foods, survey, sustainability

PO3179

CHEMICAL COMPOSITION OF SIX MEXICAN CULTIVARS OF MANGO INDOSTANO (MANGUIFERA INDICA L.)

J A. Salazar-Montoya[1], J. Pascual-Ramírez[1], E G. Ramos-Ramírez[1]

[1]Department of Biotechnology and Bioengineering, CINVESTAV-IPN, Mexico DF, Mexico

Background and Objectives: Mexico is the third largest producer of mango in the world and two groups are the mainly produces: Mulgova and Indostano. It has been widely reported that Mulgova group is a good source of nutrients and polysaccharides, but there are not enough studies about the Indostano group (Tommy Atkins, Haden, Kent, Keitt, Irwin and Gold varieties) that indicates the nutritional importance of their fractions (peel, pulp and kernel). The aim of the present work was to study some physical and chemical characteristics of Indostano varieties, as morphometric measurements, nutritional composition and pectin content.

Methods: The fruits were purchased at commercial maturity; they were analyzed by AOAC methods for the proximate chemical analysis of the peel, pulp and kernel. Pectin was extracted by acid hydrolysis and ethanol precipitation. Purity of pectin was tested by quantifications of galacturonic acid. Mean difference of Tukey ($p = 0.05$) was used to analyze the experimental data.

Results: Morphometric analysis showed that Tommy A. has highest volume and sphericity of the group. The peel was more abundant in Keitt variety, the largest volume of pulp has been obtained in Tommy and Irwin variety had the biggest seeds. The seed kernel had the highest amount of: protein in Keitt (8%), for lipids was Tommy (13%) and starch also was also Tommy variety (44%). Crude fiber was more abundant in peel of Gold, but carbohydrate fraction was the most abundant component in peel and pulp of all cultivars. The yield of pectin was lower in the pulp than peel (5% and 20%, respectively). Kent, Gold and Tommy were the cultivars with good quality pectin.

Conclusions: This research provides important information for use integrally of different cultivars of the Indostano mango. These fruits are an excellent source of complex carbohydrates and nutrients.

Key words: Mango, Indostan cultivars, pectin, galacturonic acid.

PO3180

PLANT EXTRACT IN REDUCING NEGATIVE EFFECTS OF AFLATOXIN B1 ON OXIDATIVE STRESS AND INFLAMMATION IN SWINE PERIPHERAL BLOOD MONONUCLEAR CELLS

D. Marin[1], G. Pistol[1], P. Kefalas[2], I. Taranu[1]

[1]Laboratory of Animal Biology, INCDBNA Balotesti, Calea Bucuresti nr.1, Balotesti, cod 077015, Romania

[2]Departament of Food Quality Management and Chemistry of Natural Product, MAICH, Creta, Greece

Background and Objectives: Aflatoxin B1 is a very potent carcinogen in humans, birds, swine, fish and rodents. In this study we have investigated the capacity of an extract of Curcuma longa (TR) in reducing the negative effects of AFB1 on gene expression of several markers of the oxidative stress (catalase-CAT, superoxide dismutase-SOD, glutathione peroxidase-GPx) and inflammation (cytokines: IL-8, TNF-α, IL-1β and other markers of inflammation: cyclooxygenase (Cox2) and inducible nitric oxide synthase 2 (iNOS).

Methods: TR powder was extracted with buthanol and methanol, and the dry extract was resuspended in water. Blood samples aseptically collected from healthy pigs, were diluted 1/5 in complete RPMI media, treated with 100 μM AFB1 and

150ng/mL TR and cultivated for 4h at 370C. After incubation, blood samples were centrifuged and cell pellets were resuspended in 1 mL TriReagent and total RNA was extracted. cDNA were synthesized using 1 µg of purified RNA and the evaluation of the effects of AF and TR on genes expression of above mentioned markers was realised through real-time PCR assay. The relative product levels were quantified using the 2(-Î”Î” CT) method. Results. AFB1 induced a decrease of the expression of genes involved in the oxidative stress and an increase of the genes coding for inflammatory cytokines. TR extract was able to restore the AFB1 altered expression of GPx and SOD. The effect of TR on the expression of genes involved in inflammation is under evaluation.

Conclusion: Our study shows that TR extract was efficient in restoring the expression of some genes affected in AFB1 intoxication. Supplementation of TR in diets can prevent or reduce the effects of aflatoxin in swine fed aflatoxin-contaminated diets.

Key words: Aflatoxin B1, oxidative stress, inflammation, turmeric, marker gene expression.

PO3181

DIETARY ZEARALENONE INDUCES ALTERATION IN SPLEEN INFLAMMATORY RESPONSE BY MODULATION OF METALLOPROTEINASE, NUCLEAR RECEPTORS AND MAPKS GENE EXPRESSION

G. Pistol[1], M. Gras[1], D E. Marin[1], C. Tabuc[1], I. Taranu[1]

[1]National Institute for Research and Development for Biology and Animal Nutrition, Romania

Background and Objectives: Zearalenone (ZEA) is an estrogenic mycotoxin produced by Fusarium graminearum and by other Fusarium species. ZEA is commonly found as contaminant of stored grain and has chronic estrogenic effects on mammals, being a risk factor from both public health and agricultural perspectives. Also, ZEA and its derivatives may have divergent effects on important parameters of swine innate immunity. For ZEA and other Fusarium contaminants the tolerance limits are regulated by the European Commission only by recommendation CE/576/2006, which means that new experimental evidences (in-depth investigation at the cellular level) are required.

Methods: Starting from these evidences, a feeding trial was conducted to evaluate the effect of a ZEA-contaminated diet on spleen inflammatory response in weaned pigs. A natural contaminated corn, containing ZEA (316 ppb) was included in the diet, and given to 5 weaned piglets for a period of 18 days. A group of 5 piglets which received uncontaminated diet was used as control group. The effects of ZEA on several spleen immune responses were evaluated by Real-Time PCR for MMPs, TIMPs, nuclear receptors and MAPKs gene expression analysis.

Results: Our results showed that a concentration of 316 ppb ZEA decreased MMPs (MMP-X and MMP-9) gene expression, correlated with an increase in TIMPs (TIMP-1 and TIMP-2) mRNA. Dietary ZEA leads to an increase in the expression of PPAR-γ and JNK1. Expression of mRNA for JNK2 was unmodified in comparison with control. In contrast, the expression of the genes coding for p38 MAPK and NFkB1 were decreased in experimentally intoxicated animals.

Conclusions: our study shows that ZEA altered several parameters of the inflammatory response in spleen. Therefore, our results represent additional data that could be taken into account in the determination of the regulation limit of the tolerance to ZEA.

Key words: Zearalenone, pig, spleen, inflammatory response.

PO3182

EFFECT OF PARBOILING ON AND SEASONAL VARIATIONS THE ARSENIC CONTENT IN THE MARINE BROWN ALGA 'SARGASSUM HORNERI'.

K. Murakami[1], Y. Sugawa-Katayama[2], M. Katayama[2]

[1]Department of Food Sciences and Biotechnology, Hiroshima Institute of Technology, 2-1-1 Miyake, Saeki-ku, Hiroshima, Japan

[2]Department of Health and Nutrition, Osaka Aoyama University, Japan

Background and Objectives: The seaweed Akamoku, 'Sargassum horneri' (Turner) C. Agardh, has been reported to have high levels functionaltity. Therefore, its demand as a source of foods and biochemicals is likely to increase. We have shown that the intake of 'S. horneri' may have a positive influence on the intestinal environment in rats. Further, we reported that 'S. horneri' is rich in dietary fiber and minerals and can be used for human consumption. The optimal season for harvesting the alga for human consumption may be early spring, when its growth and maturity are complete and its dietary fiber and mineral contents have reached their maximum values. However, brown algae typically contain higher concentrations of arsenic (As) than other seaweed. In this study, we assessed the effect of parboiling on and seasonal variations in the As content in 'S. horneri'.

Methods: Samples of 'S. horneri' were collected once per month from December 2005 to April 2006. The harvested plants were cleaned and washed with distilled water to remove epiphytes and encrusting materials. Their lengths and weights were then measured after blotting out the excess water. The edible portions of the seaweed (the upper 2/3 of the full leng-

th) was then washed with extra-pure water and parboiled for 1 min with 5 volumes of 2.2% NaCl solution. The As contents were then determined using atomic absorption spectrophotometry.

Results: Seasonal changes in the As contents in male plants was higher than those found in immature or female plants. The maximum As content in the plants was observed in February. Parboiling reduced the As level in 'S. horneri' by about 85%.

Conclusions: This study shows that parboiling effectively reduces the As content in 'S. horneri'.

Key words: 'Sargassum horneri', seasonal variation, arsenic, parboil.

PO3183

TRENDS IN ACRYLAMIDE LEVEL IN FOOD OVER THE LAST TEN YEARS IN POLAND

H. Mojska[1], I. Gielecinska[1], K. Stos[1], M. Jarosz[2]

[1]Department of Food and Food Supplements, National Food and Nutrition Institute, Warsaw, Poland
[2]Department of Nutrition and Dietetic with Clinic of Metabolic Diseases and Gastroenterology, National Food and Nutrition Institute, Warsaw, Poland

Background and Objectives: The International Agency for Research on Cancer (IARC) in 1994 labeled acrylamide a probable human carcinogen. Acrylamide is mainly formed in food through the Maillard reaction between free amino acids and carbonyl sources during the heating of carbohydrate-rich foods and also in the process of roasted coffee beans. Our results present acrylamide content in 601 food samples randomly selected all over Poland between 2004-2012 and trends of changes in the acrylamide level in 16 groups of food over the last ten years.

Methods: Acrylamide content was determined using GCQ-MS/MS and LC-MS/MS methods. Deuterium-labeled acrylamide (d3-AA) was used as an internal standard. The acrylamide content in food was presented as mean ± SD.

Results: The highest level of acrylamide was found in crackers, potato crisps and coffee substitutes (> 800 μg/kg). The lowest level (< 60 μg/kg) was found in various types of soft bread, rusks, oat flakes and infant food. During the last ten years in Poland we found beneficial reduction of acrylamide content in certain foods, such as potato chips (29% decrease), French fries (22% decrease), soft bread (73% decrease), biscuits and pastries (50% decrease) and roasted coffee (80% decrease). We did not observe significant positive trend of decreasing the acrylamide level in case of other tested products during these ten years.

Conclusions: Reducing acrylamide content in food is a result of the implementation of recommendations of the toolbox approach to improve industrial process in relation to acrylamide formation (CIAA) through the application of appropriate raw material and food processing methods. Due to the fact that activity did not bring expected results in all groups of food products measures to reduce acrylamide content in food should be continued.

Key words: Acrylamide, food, trends.

PO3184

ASSESSMENT OF THE QUALITY OF SALT IODISATION IN POLAND

K. Stos[1], K. Swiderska[1], I. Gielecinska[1], H. Mojska[1]

[1]Department of Food and Food Supplements, National Food and Nutrition Institute, Warsaw, Poland

Background and Objectives: In 1997 a national iodine fortification programme was introduced in Poland. Household salt should contain potassium iodide (30 ± 10 mg KI/kg of salt) or potassium iodate (39 ± 13 mg KIO3/kg of salt) which corresponds to 2,3 ± 0,77 mg/100g of salt. The aim of the study was to assess the quality of household salt iodisation in Poland between 2008–2012.

Methods: Tested material comprised 180 samples of iodized household salt taken in the studied period at randomly selected stores all over Poland. The tested samples comprised: 106 samples of vacuum salt (58.9%), 31 samples of rock salt (17.2%), 14 samples of sea salt (7.8%) and 29 samples of other kind of household salt (16.1%). The iodine content in salt was determined using iodometric method (PN-80/C-84081.34.). As a result of study the average iodine of two parallel samples was assumed. The statistical calculations were carried out using t-Student test.

Results: The iodine content in household salt was on an average 2,49 mg/100 g of salt. There were no significant differences in iodine content in different types of salt. The percentage of adequately iodised salt samples (2,3 ± 0,77 mg/100g of salt) were 83.3% in 2008, 90.6% in 2009, 96.9% in 2010, 93.8% in 2011 and 91.7% in 2012.

Conclusions: During last five years the most of tested samples of salt met Polish requirement regarding iodine content. The analysis of iodine level in household salt should be continued.

Key words: Iodine, household salt, iodometric method.

PO3185

REVALUATION OF MULBERRY TREE FROM A NUTRITIONAL POINT OF VIEW

R. López-Nicolás[1], A A. Lozano-Pérez[2], J L. Cenis-Anadón[2], G. Ros-Berruezo[1]

[1]Dpto of Food Science and Nutrition, University of Murcia, Murcia, Spain

[2]Dpto of Biotechnology and Crop Protection, Instituto Murciano de Investigación y Desarrollo Agrario y Alimentario (IMIDA), Murcia, Spain

Backgrounds and Objectives: Mulberry trees are usually grown in Oriental countries like China and Korea, and also in very specific regions of the south of Europe such as the Murcia Region. Several studies have shown that the mulberry fruit is a good source of vitamins and antioxidant compounds. However, there is very little information about leaves, which could be used as bioactive compounds-rich by-product that could be natural sources of antioxidant to be employed as ingredients in food industries. Therefore, the aim of this study was to determine the nutritional potential value (folate and antioxidant activity) of fruits and leaves of mulberry tree.

Methods: Folate (Vitamin B9) and antioxidant capacity were studied in six different varieties of mulberry tree ("kokuso", "péndula", "valenciana rizada", "valenciana temprana", "filipina", "cristiana" and "italiana"). Folate was extracted from leaves and fruits and its content was analysed by HPLC and microbiological assay. Folin-Ciocalteau and ORAC methods were used to measure the total phenolic compounds and antioxidant capacity of samples, respectively.

Results: The six varieties of mulberry tree showed differences in the level of folate. Leaves, as expected, have the highest amount of vitamin B9, reaching similar values than spinach or other folate-rich vegetables, depending on the mulberry variant. Regarding antioxidant capacity, fruits showed higher content of phenolic compounds than the leaves (38.17±7.32 vs 29.62±8.87 mg GAE/g DW). However, the total antioxidant capacity was higher in leaves (213.11±39.35 vs 136.19±14.60 μM TE/g DW).

Conclusion: Mulberry tree seems to be an interesting source of bioactive compounds. Both, fruits and leaves have been shown a high potential as source of antioxidant compounds. More studies are needed to evaluate the effect of processing on these products from mulberry to use them as antioxidant ingredients in the food industry.

Key words: Mulberry, leaves, folate, antioxidant capacity.

PO3186

ADOLESCENTS OVERESTIMATE EFFECT ENERGY DRINKS

S. Peters[1], F. Mensink[1], A. Postma-Smeets[1]

[1]The Netherlands Nutrition Centre, The Hague, The Netherlands

Background and Objectives: Main questions: 1) Which effects do adolescents experience after consuming energy drinks? 2) Do they expect a bigger effect from energy drinks than other cafeine containing drinks?

Methods: A representative sample of 755 Dutch adolescents aged 11- 18 was sent an online questionnaire. Results are described using percentages.

Results: 58% had consumed energy drinks in the past. On average adolescents consume them on 1.8 days a week and when they do, they consume 1.2 drinks. Mostly (83%), they are bought in the supermarket or drugstore. 38% drank them at school; 55% during free time. 63% expects 'energy drinks' to give the highest energy boost compared to 12% 'coffee' and 10% 'sport drinks'. Reasons to consume them are flavour (75%), energy boost (21%), becoming less tired (14%), staying awake (14%) and being able to 'keep on going' (14%). 15% consumes energy drinks because peers consume them. 47% doesn't experience effects, 28% doesn't feel tired anymore, 15% feels more alert, 14% is more able 'to keep on going'. 75% experiences side effects like hyperactivity (32%), insomnia (22%), jolt and crash (18%). Other side effects are headache (9%), palpitations (7%), irritability (6%) and shakiness (4%).

Conclusions: Adolescents overestimate the effects of energy drinks while caffeine content of coffee is similar. Reported side effects can be partly attributed to caffeine and behavioral changes based on overestimating the effects. We suggest children younger than 12 y should be advised against consuming energy drinks. Adolescents aged 13-18 y should limit consumption to a maximum of 1 caffeine containing drink a day.

Key words: Energy drinks, adolescents, expectations, side effects.

PO3187

ESTIMATION OF TARTRAZINE (E 102) INTAKE BY POLISH POPULATION

I. Traczyk[1], A. Walkiewicz[1], M. Oltarzewski[1]

[1]Department of Nutrition and Dietetics with Clinic of Metabolic Diseases and Gastroenterology, National Food and Nutrition Institute, Warsaw, Poland

Background and Objectives: Tartrazine is one of the six synthetic colours, for which the labelling of food shall include

additional information 'tartrazine or E 102 may have an adverse effect on activity and attention in children", according to the European Union legislation. Acceptable Daily Intake (ADI) set for tartrazine amounts to 7.5 mg/kg bw/day. The aim of the study was to estimate the intake of tartrazine as food additive by Polish population and the assessment of risk for human health resulting from the intake of that substance through diet.

Methods: Data on food consumption (24-hour recalls) was collected in 2000 under the FAO project "Household Food Consumption and Anthropometric Survey'. The survey covered 4134 individuals from all over Poland, aged 1-96 years. Maximum permitted levels of usage of tartrazine were taken into consideration according to the European Union regulation.

Results: The average intake of tartrazine by Polish population amounted to 28.2 mg/person/day (7.4% ADI). Taking into account P95 the intake of that colour was 24.8% ADI. The highest exposure to that substance was found in the group of youngest children (aged 1-3); mean – 18.7% ADI, P95 - 45.5% ADI. Tartrazine may be added to various products, including fine bakery wares, flavoured drinks, which can become the significant source of that colour in Polish diets.

Conclusions: Taking into account the food market development with increasing usage of additives, including colours, it is necessary to educate population on the selection of foodstuffs in the daily diet. Adherence to the principles of proper nutrition and where possible the use of unprocessed foodstuffs can support lower intake of food additives from diet.

Key words: tartrazine, colour, diet, intake

PO3188

ASSESSMENT OF FOOD WASTE IN NUTRITION AND FOOD SERVICE BEFORE, DURING AND AFTER CONCERNING CAMPAIGN

R. Vieira[1], M. Parizotto[1], S. Martinelli[2], R. Cortese[2]

[1]Departamento de Nutrição, Universidade Estadual Do Centro Oeste-UNICENTRO, Guarapuava, Paraná, Brasil

[2]Departamento de Nutrição, Universidade Federal de Santa Catarina-UFSC, Florianópolis, Santa Catarina, Brasil

Background and Objectives: The food waste occurs in the whole production chain, since the production, storage, transport, processing, retail, until home and restaurants kitchens. In this context, is the Food and Nutrition Service, where the waste is a commonly problem. This way, it can be noticed managers' preoccupation about food waste are on the rise and different solutions to reduce food waste have been taken, that can also be performed in collaboration with the diners, who can be included in actions aimed to waste reduction, such as concerning campaign. This way, the current research evaluated the effectiveness of a concerning campaign to reduce food waste by diners in a food service and analyze food waste before, during and after the concerning campaign.

Methods: The data's collection occurred in 21 days. For the first 8 days, it was collected the required data to calculate the plate waste and leftover rates, the following 5 days the concerning campaign to diners was performed through posters fixed on the refectory' wall and kept the same data collection. After the campaign, during 8 days more, the data were collected.

Results: The results appointed high leftover rates, averaging 19,5%, 17,5% and 13,6% before, during and after the campaign, respectively. The plate waste rate decreased significantly during and after the campaign to diners. Before the campaign the average of plate waste rate was 9%, decreasing to 6,5% during the campaign and 6% after the intervention.

Conclusions: Therefore, it was confirmed that the concerning focused on diners to reduce the food waste was effective.

Key words: Food waste, food service, plate waste rate, leftovers, concerning campaing.

PO3189

VALIDATION OF A NUTRIENT PROFILE MODEL FOR SOUTH AFRICA TO ASSESS THE ELIGIBILITY OF FOOD STUFFS FOR HEALTH CLAIMS

E. Wentzel-Viljoen[1], J C. Jerling[1], M. Wicks[1], S. Lee[1], H H. Vorster[1]

[1]Centre of Excellence for Nutrition, North-West University, Potchefstroom, South Africa

Background and Objectives: The use of a nutrient profiling model (NPM) as a criterion for making nutrient and/or health claims aim to avoid a situation where claims mask the overall nutritional status of food products, which could mislead consumers when trying to make healthy food choices. The aim was to validate the NPM of FSANZ and to provide a scientific basis to assess the eligibility of food stuffs to carry health claims in South Africa. The "Guiding principles and framework manual for the development or adaptation of nutrient profile models" of the WHO was used as the guide.

Methods: Five methods were applied including construct validity (using FBDG, Diet Quality Index, linear programming) and convergent validity (based on dietitians).

Results: The agreement between the way the model and the FBDGs categorises food products was substantial. There was good correlation between the classification of food products by the NPM and the views of dietitians. The consumption of foods categorised as 'being eligible to carry a health claim' by the NPM are higher in people who have 'healthy' diets than

people who have 'unhealthy' diets. A plausible theoretical 'healthy' diet can be constructed from only foods eligible to carry a health claim and no such plausible theoretical diet can be constructed from only foods that would be ineligible to carry a claim. The quality of the diet can be improved when foods not eligible to carry a health claim are replaced by foods that would be eligible to carry a health claim. Challenges included incomplete food composition tables and the limited number of food items consumed by the participants in the database used for validation.

Conclusions: The results of all the validation studies taken together suggested that the FSANZ NPM is a valid instrument for use in the South African food and nutrition environment.

Key words: Nutrient profiling, health claims.

PO3190

MICROBIAL METABOLISM AND INTESTINAL ABSORPTION OF THE MYCOTOXIN DEOXYNIVALENOL AND ITS METABOLITES IN HUMANS

S W. Gratz[1], G. Duncan[1], A J. Richardson[1]

[1]Rowett Institute of Nutrition and Health, University of Aberdeen, UK

Background and Objectives: Deoxynivalenol (DON) is a potent mycotoxin produced by Fusarium moulds and affects nutrient absorption and intestinal barrier function. Free DON and the plant metabolite DON-3-glucoside (D3G) are frequently found in cereals including wheat and maize. Aim of this work is to assess the metabolism of DON and D3G by human faecal microbiota and to study the intestinal absorption of DON metabolites in humans using urinary exposure biomarkers. Method: Fresh faecal samples from ten volunteers were prepared into faecal slurries using M2 culture medium, spiked with DON or D3G and incubated anaerobically for up to 7 days. Mycotoxins were extracted into acetonitrile and detected using LC-MS/MS. Spot urine samples were collected from the same volunteers, cleaned through immunoaffinity columns and mycotoxins were detected using LC-MS/MS.

Results: We found that faecal microbiota from all ten volunteers efficiently cleaved D3G and released free DON, with hydrolysis peaking after 4-6 hours of incubation. Faecal microbiota of two out of ten volunteers detoxified DON to DOM-1. This is the first evidence of DON detoxification by human faecal microbiota. DON was detectable in all urine samples tested. Additionally, DOM-1 was detectable in urine samples of the same two volunteers who harbour the detoxifying microbiota at ratios of 1.5 - 16% of urinary DON. D3G was not detectable in urine.

Conclusion: Our results indicated that DON is readily absorbed in the intestinal tract of humans. D3G is not absorbed but hydrolysed by colonic microbiota hence exposing the colon to free DON and increasing the toxic burden to exposed individuals. Some individuals also harbour microbiota capable of detoxifying DON to DOM-1, which could lead to a modest protection against potential DON toxicities in the large intestine. Future dietary intervention studies will assess DON exposure from different cereal products.

Key words: Mycotoxin, deoxynivalenol, metabolism, microbiota, human.

PO3191

OBTAINMENT OF CHEESE WHEY PROTEINS HYDROLYSATES BY IMMOBILIZED ALCALASE

R. Monti[1], J C. Bassan[1], N R. Salome[1], A F. Santos[2], T M S. Bezerra[2], A L C. Caravante[1], A. J. Goulart[1]

[1]Faculdade de Ciencias Farmaceuticas, UNESP Univ Estadual Paulista, Sao Paulo, Brazil
[2]Instituto de Quimica, UNESP Univ Estadual Paulista Sao Paulo, Brazil

Background and Objectives: Proteins are widely used for supplementation and dietary replacement. However, the enzymatic hydrolysis of these proteins has improved their functional and nutritional properties generating high-quality products. Alcalase has been widely used for the production of proteic hydrolyzates and its immobilization can bring important economic and processing benefits. This work shows the partial hydrolysis of cheese whey proteins by free and immobilized alcalase on corncob powder (CP).

Methods: The cheese whey (CW) was dialyzed and treated with kaolin and subsequently analyzed in relation to total proteins (7.96mg.mL-1), lactose (97.5% removal) and fat (not detected). Immobilization of the enzyme on glyoxyl-CP used NaHCO3/Na2CO3 0.1 mol.L-1 buffer pH 10. The activity of the enzyme and the derivative (alcalase-CP) was monitored by the hydrolysis of Z-Gly-Gly-pNP at 405 nm (ε = 4,741.3 $M^{-1}.cm^{-1}$). The hydrolysis of 5 mL of the CW was carried out during 120 min, 50°C, pH 9 using different concentrations of free enzyme and derivative. Hydrolyzates were analyzed by SDS-PAGE.

Results: The activity of free and immobilized alcalase were 149.35 $U.mL^{-1}$ and 11.05 $U.g derivative^{-1}$, respectively. Optimal pH and temperature were 50°C and 9.0, respectively, for both free and immobilized enzyme. Electrophoresis analysis indicate that alcalase-CP hydrolyzed CW proteins efficiently by the formation of smaller peptides in the range of 14.4kDa, featuring partial hydrolysis.

Conclusions: Many of the cheese whey peptides have important bioactive properties and alcalase-CP was efficient in generate peptides by a clean process and with low production

cost, ensuring this methodology as an important tool for obtaining protein hydrolyzates.

Key words: Cheese whey proteins, protein hydrolysis, alcalase. Acknowledgements: CNPq, FAPESP, CAPES, PNPD/CAPES.

PO3192

MEALS PRODUCTION AND SUSTAINABILITY: ASSESSMENT OF WASTE GENERATION IN AN UNIVERSITY RESTAURANT

L. Seabra[1], S. Aquino[1], E. Fernandes[1], C. Carneiro[1], P. Rolim[1]

[1]Nutrition Department, Federal University of Rio Grande do Norte, Natal, Brazil

Background and Objectives: The growing number of people who have meals outside the home, favored an increase in the number of Food Services in the country. The advancement of the production segment of collective meals, resulted in the increase of solid waste generation. Thus, the objective was to take actions that promote the reduction of solid waste generation and evaluate the cost of food waste in a university restaurant located in Natal/RN - Brazil.

Methods: This was a cross sectional study, quantitative and descriptive. Initially it was accomplished a sensitization to the restaurant employees, in order to raise awareness them on the subject of current research, in a second step, we quantifyed the inorganic and organic solid waste for 32 days by direct weighing, from area of pre-preparation of meat, juice processing area, an area for pre-preparation of cold foods, area of pre-preparation of vegetables and cooking area. Besides the direct weighing of leftovers and plate waste from the washing area of cookware and utensils, respectively, as well as inorganic wastes from the warehouse. From the data obtained, we evaluated the cost of wasted food in the restaurant.

Results: We obtained a total of 14,934.56 Kg of organic waste and 2.030,35 Kg of inorganic waste. Regarding plate waste, we obtained an average of 13.4%, representing a total of 6047 meals wasted, generating a cost of approximately $ 9.070,00 per month.

Conclusions: Based on the results of this study, as well as highlighting the importance and necessity to complete the production of food and sustainability is possible to propose strategies aimed at reducing and/or minimizing the amount of solid waste generated in the restaurants.

Key words: Foodservice, Solid waste, Sustainability.

PO3193

A CASE STUDY: NUTRITIONAL STATUS OF WORKERS FROM A INSTITUTIONAL FOODSERVICE

L. Seabra[1], P. Rolim[1], E. Fernandes[1], A. Cardonha[1]

[1]Department of Nutrition, Centre of Health Sciences, Federal University of Rio Grande do Norte, Brazil

Background and Objective: Food offered in the foodservices can provide health to their users or increase the likelihood of Chronic Non-Communicable Diseases (CNCD), mainly in the case of foodservices that serve a captive clientele. These diseases are reflected in the large number of deaths and expenses involved in healthcare in Brazil, as well as the impact on sustainability, given that the economic factor related to health costs and the health of the population represents the three pillars of sustainability. The objective of the study was to determine the nutritional profile of clientele served at an institutional foodservice, discussing the findings in terms of sustainable meal preparation.

Methods: the methodology was based on the assessment of Body Mass Index (BMI) and height in a sample of clientele served by the foodservice. Next, their nutritional status was determined. The results were compared with other studies and their impact on health was discussed according to the literature. From the nutritional assessment of clientele served at the foodservice, it was possible to diagnose 'overweight' in both genders.

Results: A total of 328 individuals (164 women and 164 men) were evaluated and the data demonstrated that the population under study exhibited above-normal body weight. 50% of the women and 28.4% of the men had eutrofic BMI; 38.4% (women) and 54.7% (men) had overweight BMI, corroborating other studies, which indicate that excess weight is an important public health problem worldwide, since it is associated with mortality and the development of CNCD.

Conclusion: Foodservices should have a qualified nutritionist in order to provide food that avoids or prevents CNCD, thereby reducing future health burdens and contributing to sustainable meal preparation, by ensuring the well-being and health of individuals.

Key words: Foodservice, Chronic Diseases, Overweight and Sustainability.

PO3194

EFFECT OF LYOPHILIZATION PROCESS ON PROFILE OF FAT ACIDS IN AVOCADO PULP

E. Valdés[1], M. Castañeda[2], M R. Rodríguez[2], K. Franco[1], M. Guzmán[1]

[1]Behavioral feeding and nutrition research center, Cusur, University of Guadalajara, Jalisco, México
[2]Regional development departament, Cusur, University of Guadalajara, Jalisco, México

Background and Objective: Mexico is the world's largest producer of avocado (Persea americana). During the last 20 years its volumes of production, trade and industrialization have grown spectacularly. Lyophilization is an alternative for food preservation. The aim was to determine the effect of lyopilization process on the profile of fat acids in fresh and lyophilized pulp of avocado. Method: Twelve samples of 3 kg of fruit at physiological mature of the Hass variety, in Jalisco (Mexico) were obtained. Samples were divided in two equal parts and one portion was lyophilized. After the two samples were divided three sub-samples . Fat acid analysis by gas chromatography was performed. Data was analyzed using ANOVA and Tukey test ($p < 0.05$).

Results: The groups were significantly different in variables for monounsaturated fat, oleic acid and linoleic acid. The monounsaturated fat showed 48.00 y 48.83 % in fresh and lyophilized pulp respectively. The lyophilization process significantly decreased the concentration of oleic acid of 43.54 to 40.64% and linoleic acid of 8.70 to 7.31%. In contrast, no significant differences were presented for saturated fat with values 12.85 % ± 1.67 and 13.67 ± 0.56; in polyunsaturated with 8.84 ± 1.73 and 7.45 ± 1.22; in palmitic acid, with 13.61 ± 1.80 and 12.67 ± 0.56; in palmitoleic, with 4.54 ± 1.11 and 5.17 ± 0.44 in fresh and lyophilized pulp, respectively.

Conclusions: The lyophilization process significantly decreased the concentration of two fat acids.

Key words: Avocado, lyopilization, fat acids.

PO3195

STRATEGIES FOR THE IMPROVEMENT OF THE NUTRITIVE QUALITY AND ENERGY VALUE OF THE TRADITIONAL" MURCIA'S MEAT PIE"

D. Ruiz-Cano[1], F. Pérez-Llamas[1], J A. López-Giménez[1], M J. Frutos[2], S. Zamora[1]

[1]Universidad of Murcia, Murcia, Spain
[2]Miguel Henández University, Elche, Alicante, Spain

Background and Objectives: The Murcia's meat pie (MMP) is a traditional food of the Murcia's gastronomy, with the following average composition per 100g of product: 29 g of carbohydrates, 17 g of fat, 11 g of proteins and 320 kcal. The objective of the research is to develop different strategies to improve the MMP nutritional quality and reduce its energy value.

Methods: The MMPs analyzed were elaborated with a traditional process by bakers of the bakery enterprises association in the Murcia Region (AREPA). Different types of beef meat were selected (normal, semi-lean and lean) for the elaboration of the pie filling. In the samples several parameters were determined (water content, minerals, carbohydrates, proteins, fat and energy).

Results: Among the different types of meat used in the study, the protein content varies in the range 14-19%, and the amount of fat between 8 and 30%. When the average values of energy, carbohydrates, proteins and fat in the traditional MMP are compared with those elaborated with the semi-lean meat (carbohydrates 11g, proteins 11g, fat 18g and 249 kcal) and lean meat (carbohydrates 17g, proteins, 11g, fat 12g and 222 kcal), the results show that protein content is not modified by the different meat used, however the percentages of fat and energy are significantly reduced.

Conclusion: Owing to the use of different type of meat, the fat content in the MMP has been reduced in a 29.4% and therefore its energy in a 31%, without modifying the content of a high biological value protein of the meat pie.

Key words: Meat pie, nutritive quality, beef meat, energy. Acknowledgments: This research was supported by the Project 18575/PAE/11 and the fellowship 187579/BPC/12 granted by the "Fundación Séneca" of the Science and Technology Agency of the "Region de Murcia".

PO3196

ESSENTIAL MINERAL COMPOSITION OF CASHEW APPLE POWDER FROM VENEZUELA

A. Bravo[1], M. Amaro[2], J. Puentes[1], J. Mejia[1], D. Villalobos[1], D. Bravo[1], T. Rincon[1], B. Montilla[3], M. Colina[3]

[1]Laboratory of Research and Development in Nutrition (LIDN), University of Zulia, Maracaibo, Venezuela
[2]Department of Bromatology and Food Tecnology, University of Cordoba, Cordoba, Spain
[3]Department of Chemistry, University of Zulia, Maracaibo, Venezuela

Background and Objectives: Anacardium occidentale L. (cashew) is a crop of great interest because the biological properties derived from its chemical composition. Rural people from Zulia region in Venezuela, has focused mostly on the artisanal use of cashew nut, while the pseudofruit or cashew apple is discarded. It is therefore desirable to assess future in-

gredients which may be obtained from pseudofruits, in order to formulate healthy foods for human consumption. Of great importance for the health are the essential minerals, because they play a key role in the body functions. An alternative to the use of cashew is making cashew apple powder. The aim of the study was to determine the content of sodium (Na), potassium (K), calcium (Ca), magnesium (Mg), iron (Fe), zinc (Zn), copper (Cu), selenium (Se), manganese (Mn) and cobalt (Co) in cashew apple powder.

Methods: The cashew apple powder was produced experimentally by drying and grinding of pseudofruits creole type (red) which were harvested in growing areas located in the Villa del Rosario de Perija, Zulia State, Venezuela. The pseudofruits were squeezed and dried in an oven for 48 hours at 65°C. Subsequently, the material obtained was ground, sieved and packed in bags for characterization. The concentration of the elements was determined by Inductively Coupled Plasma Mass Spectrometry (ICP-MS).

Results: Minerals were found in the following decreasing order of abundance in the cashew apple powder: K>Mg>Ca>Na>Fe>Cu>Zn. Se and Co were not detectable. The mean concentration of the elements was (mg/100g): Na 18.82, 503.64 K, Ca 23.61, Mg 56.66, Fe 3.58, Zn 1.56, Cu 1.67 and Mn 0.66.

Conclusions: The cashew apple powder may represent an alternative source of essential minerals for the development and formulation of new products through simple technological processes.

Key words: Essential minerals, cashew apple powder, ICP-MS, food development.

PO3197

QUANTITATIVE ANALYSIS OF SODIUM IN BREADS AND BISCUITS CONSUMED BY THE POPULATION OF RIO DE JANEIRO, BRAZIL

A. Nicolau[1], L. Rodrigues[1], M. Nilo[2], M. Alves[2], A. Teodoro[2]

[1]Departament of Public Health Nutrition, Federal University of The State of Rio de Janeiro, Rio de Janeiro, Brazil

[2]Departament of Food Technology, Federal University of The State of Rio de Janeiro, Rio de Janeiro, Brazil

Background and Objectives: Eating habits have changed among Brazilians, the majority of industrialized food has a high amount of salt. A high salt diet during childhood could increase the risk of diseases including hypertension, osteoporosis, kidney disease and obesity. Based on substantial evidence about the association between elevated salt intake and diseases, researches about the amount of sodium present in food have a great importance to the Public Health aiming to reduce this problem. The main objective of this study is describe the level of sodium found in breads and biscuits consumed by children.

Methods: Were collected 5 samples of sliced bread and 20 samples of biscuit corresponding to the most consumed brands among children, identified through dietary recall from 30 children attended by the ambulatory of Pediatric Nutrition at the University Hospital. The determination of sodium was carried out by adapted Mohr's method. The analysis of biscuits and bread were made by Departament of Food Technology at the Federal University of the State of Rio de Janeiro.

Results: The results of biscuits analyses revealed a high sodium content with values of 192,04 mg of sodium per serving, equivalent to an average of 9,6% of the Recommended Daily Intake (RDI). In addition to this 55% of the samples had sodium values higher than those declared on the label. The analysis of sliced bread found results ranging from 435.32mg/50 g to 499.73 mg/50 g of sodium between the five most consumed brands by the population.

Conclusions: Results indicated that consumers do not receive accurate information about the sodium content of packaged foods from label. The values found through analysis were higher than the labeling.

Key words: Eating Habits, sodium, labelling and disease.

PO3198

FORTIFICATION OF RICE WITH MICRO-NUTRIENTS USING HIGH PRESSURE PROCESSING

N. Thiruselvam[1], J. Arcot[1], J. Paterson[1]

[1]Food Science and Technology, School of Chemical Engineering, The University of New South Wales Sydney, Australia

Background and Objectives: Deficiency diseases due to insufficient micronutrients in the diet especially vitamin A, iron, and folic acid is a worldwide scenario especially in the developing countries. Therefore, fortification of rice which is a staple food in many developing countries with these micronutrients could be an effective way to reduce under-nutrition (Bierlen et al. 1997). Previously fortification of rice has been successful using genetic engineering, extrusion technique and parboiling, the latter two being heat treatments. A non-thermal novel food processing technology namely High Pressure Processing (HPP) was explored to assess the feasibility and extent of retention of added vitamins.

Methods: About 25 grams of milled rice was soaked in 40 ml of distilled water along with β-carotene (4.2 mg), folic acid (10 mg) and iron (1.7 mg) and was treated using HPP at 200 and 400 MPa for 1h, 2h and 3h. Following HPP treatment the

rice was air dried for 48 hours. The retention of β-carotene and folic acid and iron were analysed using HPLC and ICP-OES.

Results: The highest retention for folic acid was observed at 200 MPa treatment for 1 hour (30%). For β-carotene the highest retention was observed at 200 MPa treatment for 3 hours (5%). For Iron, the high retention was observed under 200 MPa treatment for 1 hour (50%).

Conclusion: It seems that High Pressure Processing can be an effective and innovative method for fortification of rice with more than one vitamin simultaneously at the same time thereby making it another feasible approach for rice fortification and enabling further exploration in this area.

Key Words: High Pressure Processing, Folic Acid, Iron, β-carotene.

PO3199

CONSUMERS WITH THE INFORMATION ON THE GENETICALLY MODIFIED FOOD LABELING: EVIDENCE STUDY

J. Sanz-Valero[1,2,6], M I. Sebastián-Ponce[2], C. Wanden-Berghe[3,4,6], A. Gil[5,6]

[1]Department of Public Health and History of Science, Miguel Hernandez University, Elche, Spain
[2]Department of Public Health and History of Science, University of Alicante, Alicante, Spain
[3]Department of Pharmacy, CEU Cardenal Herrera University, Elche, Spain
[4]Home Care Unit, General University Hospital of Alicante, Alicante, Spain
[5]INYTA, University of Granada, Granada, Spain
[6]Communication and Scientific Documentation in Nutrition Group (CDC – Nut SENPE), Madrid, Spain

Background and objectives: It is clear that the use and consumption of genetically modified foods (GM) is a known fact. To know the opinion that consumers of different countries and cultures have about GM and the information through labeling.

Methods: A systematic review of the scientific literature on GM labeling was conducted from the consultation of bibliographic databases (MEDLINE -via Pubmed-, EMBASE, ISI-Web of Knowledge, The Cochrane Library, Food Science and Technology Abstracts, LILACS, CINAHL and AGRICOLA) using the descriptors (Medical Subject Headings) "organisms, genetically modified" and "food labeling". The search was limited to human's adults. The resulting search equation was defined with the Boolean connectors. The final equation was adapted to each of the bibliographical databases consulted. Additionally, as a secondary search, the bibliographies given in the selected articles were reviewed in order to identify studies not found by the primary search (in order to reduce potential publication bias).

Results: Forty articles were selected after applying the inclusion and exclusion criteria. All of them should have conducted a population-based intervention focused on consumer awareness of GM foods and their need or not, to report on the labeling.

Conclusions: Label should be homogeneous, clarify the degree of tolerance of GM in non-GM products and the content or not of GM, and how these commodities are produced. Label should also be accompanied by the certifying entity and the contact information. Anyway, consumers express their preference for non-GM product and they even notice that they are willing to pay more for it, but eventually they buy the item with the best price, on a market that welcomes new technologies.

Key words: Food labeling; Organism, genetically modified; Food security; Health promotion; Health policy.

PO3200

DEVELOPMENT OF MULTIPLEX PCR ASSAY TO FRAUD IDENTIFICATION IN SAUSAGES

F. Tafvizi[1], F. Parchami Nejad[2], S E. Hosseni[2], M. Tajabadi Ebrahimi[3]

[1]Department of Biology, Parand Branch, Islamic Azad University, Tehran, Iran
[2]Department of Agriculture & Natural Resource, Science and Research Branch, Islamic Azad University, Tehran, Iran
[3]Department of Biology, Central Tehran Branch, Islamic Azad University, Tehran, Iran

Background and Objectives: Detection of species fraud in meat products is very important to protect consumers from undesirable adulteration as well as economic, religious and health aspects. The most important reason for verification of the labeling statements is the fraudulent substitution of expensive meat components with other cheaper animals or mislabeled. Multiplex PCR is a modified PCR to rapidly detect the fraud identification in meat products. The aim of this study was to develop a Multiple Template PCR Reaction for simultaneous identification of multiple meat species.

Methods: In this study, 10 sausages with minimum content of 55% beef from 10 different manufacturing companies were collected from food markets of Tehran-Iran and 5 samples of raw meats of beef, hen, goat, camel and donkey for the purpose of positive control. Total DNA was extracted from 30 mg of each sausage and raw meats as well according to Sambrook method with some modifications. Primers were designed in different regions of mitochondrial DNA (12S rRNA, cytochrome b and NADH dehydrogenase subunits 2.

Results: 12S rRNA and NADH dehydrogenase subunits 2 primers generated specific fragments of 183 and 145 bp leng-

th, for poultry and donkey, respectively. Three different specific primers were used for amplification of cytochrome b gene in goat, camel and beef species and amplified species-specific DNA fragments of 157, 200 and 274bp, respectively. The results proved that half of the specimens had contaminated with poultry residuals, more than the share of beef, unlike their labeling. The other half only had poultry residuals, no beef content. No contamination with goat, donkey and camel residuals was observed.

Conclusions: These findings showed that molecular methods such as Multiplex PCR is potentially reliable, sensitive and accurate assay for detection of adulteration meat species in mix meat products.

Key words: Meat species, Multiplex PCR, Mitochondrial DNA, Sausage.

PO3201

THE SOME LIVER PROTECTION CHARACTERISTICS OF ARTICHOKE "CYNARA SCOLYMUS" ACCLIMATED IN MONGOLIA

P. Mejeenov[1], A. Miyegombo[2], B. Luvsanbaldan[3], T. Tseepil[4]

[1]Department of Nutrition, Food and Biotechnology School, Mongolian University Science and Technology, Mongolia
[2]'Monos' Medical University, Mongolia

Background and Objetive: Nowadays, most studies shows that many healthy problems are strictly related to our diet behaviors and weight surplus. Mongolia locates in central Asia, and Mongolian soil is rich by many kinds of minerals. Therefore all of acclimatized and grown plants in Mongolian soil, especially, vegetables and medicinal herbs contain nutrients very high. Since 2007, we wanted to try to acclimatize Artichoke, which is very famous by beneficial characteristics plant in the world in Mongolian condition. In this study, we investigated the effect of artichoke leaf extract pretreatment on carbon tetrachloride (CCl4)-induced acute liver dysfunction.

Methods: Animals were divided into 2 groups. Group 1: control rats. Group 2: study rats. Rats were given artichoke leaf extract (20 mg/kg/day) by gavage for 3 weeks and after then CCl4 (0.1ml/kg during the 5 day; Skakun NP, 1990) was applied. Group 2 were continued artichoke gavages for 4 weeks after injection. At the end of the experimental period, all animals were killed for biochemical and histological parameter measurements.

Results: In vivo, controlled clinical trial of rats with acute liver dysfunction has demonstrated the effectiveness of artichoke leaf extract for lowering SGPT/SGOT level. Total transferase (SGPT/SGOT) in the group that received the artichoke extract was decreased 1.13-1.3 times compared to the control group. GGT level was also significantly decreased in study group. In addition, one of major indicator of liver dysfunction, alkaline phosphatase which is an enzyme in the cells lining the biliary ducts level, was lower than the control group.

Conclusion: In rats pretreated with artichoke extract, significant decreases in plasma transaminase activities were found. The research findings indicate that in vivo artichoke leaf extract may be useful for the prevention of liver dysfunction and hepato toxicity.

Key words: Acclimated artichoke, acute hepatitis, liver protection, enzyme.

PO3202

SEASONAL DIFFERENCES IN DIETARY DIVERSITY AND FOOD SECURITY AMONG WOMEN HORTICULTURALISTS: A STUDY IN EASTERN MALI

M C. Dop[1], A S. Savadogo[2], F. Dara[2], M. Touré[2], A. Diallo[2], M B. Sissoko[3]

[1]Institut de Recherche Pour le Développement, Montpellier, France
[2]Nutrition Coordination Unit, MDG-F programme, Bandiagara, Mali
[3]FAO Representation, Bamako, Mali

Background and Objectives: The study was part of the "Millenium Development Goals UN programme: Improving child nutrition and food security in the most vulnerable municipalities in Mali", implemented in the Bandiagara district. Support was provided to women horticulturalists to increase their dietary diversity. The intervention consisted in training and tools for the production of shallots and other vegetables. A control group of women horticulturalists not benefiting from the intervention was selected in the same area. At the start of the programme, baseline surveys were conducted in 2011 during the dry season of shallot production (April) and at the end of the rainy season (October).

Methods: Individual dietary diversity, a proxy of micronutrient adequacy, was assessed following FAO guidelines (2011). Questions on household food insecurity were adapted from FANTA (Coates et al, 2007).

Results: The groups of women did not differ for the variables of interest, therefore data were pooled (n=398). Women's mean dietary diversity scores were higher during the dry season than at the end of the rains (3.7 ± 1.4 out of 9 food groups, and 2.1 ± 1.1, respectively) ($p<0.001$). For all food groups except cereals, there was a large decline in consumption between seasons: the percentage of women consuming vitamin A-rich foods and iron-rich foods fell from 89 to 45%, and 49 to 18% respectively ($p<0.001$). Food insecurity was more prevalent at

the end of the rains. The decline in dietary diversity between seasons, was more marked in women of food insecure households.

Conclusion: There are large seasonal differences in horticulturalist women's dietary diversity: at the end of the rainy season dietary diversity is very low, implying that the women are at high risk of micronutrient deficiencies. Food insecurity is a major determinant of low dietary diversity.

Key words: Women's dietary diversity, food insecurity, horticulture, West-Africa.

PO3203

ECONUTRITION WITHIN REACH: A FRAMEWORK TO ASSIST DECISION-MAKING IN LARGE-SCALE NUTRITION INTERVENTIONS

J. Fanzo[1], B. Luckett[2], F D. Clerck[3], D. Rose[2]

[1]Institute of Human Nutrition, Columbia University, New York, NY, USA
[2]Department of Global Community Health, Tulane University, New Orleans LA, USA
[3]Agrobiodiversity and Ecosystem Service Program, Bioversity International, Rome, Italy

Background and Objectives: Econutrition, a transdiciplinary approach that links ecological processes, agricultural systems, and human health has the potential to improve nutritional outcomes and create more sustainable environments. Yet, principles from this hybrid field are not well understood or integrated into nutrition programming. This presentation identifies ecosystems concepts relevant for nutritional improvement and promotes their integration into the planning of large-scale interventions through enhancement of current monitoring and evaluation tools.

Methods: An extensive literature review from the fields of agriculture, ecology, economics, health and nutrition was conducted by an interdisciplinary team of scientists to develop a conceptual framework linking sustainable food systems to nutrition outcomes. Expert opinion on the framework and how it could be integrated into nutrition programming was obtained by interviewing key stakeholders from United Nations food and nutrition agencies and applied to the UN REACH (Renewed Efforts Against Child Hunger and Undernutrition) program. REACH seeks to scale-up effective nutrition interventions by coordinating multi-sectoral efforts, strengthening nutrition governance and developing national capacity.

Results: A new conceptual framework was developed that builds upon the 1990 UNICEF model. The framework delineates immediate and long-term determinants of child undernutrition, and highlights ecological factors in the causal pathways. Modifications to a key decision-making tool used by REACH, known as the 'REACH Dashboard,' were developed to facilitate use of the framework by multiple stakeholders.

Conclusion: Ecosystems can support human nutrition both directly through the provision of diverse and sufficient foods and indirectly through expanded and sustainable livelihoods. The framework developed here illustrates these linkages as well as the contributions that other sectors, such as agriculture, education, and social protection, can make to improved nutrition. Incorporating an ecological systems perspective into large initiatives like REACH can facilitate multi-sectoral coordination in the scale up of nutrition actions.

Key words: Ecosystem, undernutrition, policy, programming.

PO3204

WHOLE GRAINS: SCIENTIFIC RATIONALE FOR DIETARY GUIDANCE, WHOLE GRAIN FOOD DEFINITION AND PRODUCT INNOVATION

M. Tucker[1], K. Wiemer[1], S. Jonnalagadda[1]

[1]General Mills Bell Institute of Health and Nutrition, Golden Valley, USA

Background and Objetives: Much of the science about whole grains and their associated benefits are widely accepted. Whole grains have three key components, the bran, germ and endosperm, and each component contains different nutrients and phytonutrients. Whole grain consumption is associated with reduced risk of heart disease, diabetes, and certain cancers, as well as lower BMI, yet many consumers are not meeting the recommendations. Methods and

Results: Despite the many known benefits of whole grain, some challenges exist. Globally, the whole grain dietary guidance and definitions of whole grain foods are inconsistent. Specifically, a need for the development of universally accepted criteria and definition for a whole grain food was identified by the 2010 US Dietary Guidelines Advisory Committee. Whole grain foods are not consistently defined in research and, in the global market place, whole grain qualification standards vary among government and private entities. Without a uniform definition, confusion in the marketplace prevails: whole grain food package labeling lacks standardization, benefits of whole grain and fiber are often intertwined in communication, and consumers may be confused in their pursuit for whole grain foods.

Conclusions: Developing consistencies in whole grain dietary guidance and agreeing on a global whole grain food definition would enable the advancement of whole grain research and market presence of whole grain foods. Consistent labeling of whole grain foods would help consumers identify whole grains in foods and enable them to meet dietary recommen-

dations. This presentation will provide an overview of global whole grain dietary recommendations and regulations, whole grain food product development, and opportunities for consumer education. All of these factors can help enable not only establishing a whole grain food definition, but also identify a path toward achieving global whole grain dietary recommendations.

Key Words: Whole grains, health benefits, food definition, product innovation.

PO3206

EFFECT OF MICROWAVE IRRADIATION VS HEATING BY CONVENTIONAL METHOD ON THE IN VITRO DIGESTIBILITY OF BOVINE WHEY

I. Bouchikhi[1], H. Kaddouri[1], D. Redouane[1], K. El Mecherfi[1], A. Chikhi[1], H. Negaoui[1], O. Khéroua[1], D. Saidi[1]

[1]Laboratory of Physiology of the Nutrition and Food Safety, Department of Biology, University of Oran, Es-Senia, Oran, Algeria

Background and Objectives: Thermal processing of milk, is a common practice. Heating induces several chemical and physical changes in whey proteins. Microwave irradiation (MWI) is an alternative method to a conventional heating. Although MWI effects on bovine milk proteins were studied, there is a lack of information about its effect on digestibility. The purpose of this study was to determine MWI effects on the in vitro digestibility of bovine whey proteins compared to conventional heating effects.

Methods: The bovine whey, reconstituted in phosphate buffer, was submitted to microwave irradiation or heated by conventional method. The study of the in vitro protein digestibility was carried out by hydrolysis using pepsin, trypsin and chymotrypsin enzymes. Whey protein alteration was assessed with sodium dodecylsulfate-polyacrylamide gel electrophoresis (SDS).

Results: MWI did not alter whey protein susceptibility to pepsin. Whereas it led to their partial hydrolysis by either trypsin and chymotrypsin enzymes. This hydrolysis was more pronounced when microwaves were applied at high power but for a shorter duration. Heated whey by conventional method were resistant to pepsic hydrolysis but was observed to be susceptible to chymotrypsic and trypsic hydrolysis. This improvement of enzymatic hydrolysis was more pronounced when heating takes only shorter duration.

Conclusions: MWI or heating by conventional method accelerates whey proteins hydrolysis. This effect was more pronounced with heating using conventional method.

Key words: Whey, Microwaves, Enzymatic hydrolysis, dodecylsulfate, polyacrylamide gel electrophoresis.

PO3207

STORAGE OF THE PACKED FOOD AND FOOD QUALITY

A. Benini[1], C. Mekhancha-Dahel[2]

[1]Mentouri Constantine University, INATAA, Algeria
[2]ALNUTS Laboratory, Mentouri, Constantine University, INATAA, Algeria

Background and Objetives: storage conditions and influential transport on the quality of foodstuffs and favor the interaction between the contents and its packaging. The objective of our work is to know in which conditions are stored food packed to Batna (Algeria).

Methods: a survey was realized to Batna from May 15th till September 15th, 2011, on the storage conditions of the packed food, at wholesalers at the level of the deposits of storage. Photos were taken in various places for the plastic, metal packagings, the cardboard and the glass. 40 descriptive index cards were prepared according to the various packagings and informed for every food. We compared every case with the Algerian legislation and proposed the improvements according to the type of packaging, the food and storage conditions.

Results: the report is the following 1) Most of the wholesalers do not respect the conditions of the storages and transport of the packed foodstuffs; 2) The plastic bottles are exposed to sunbeams; 3) There is no respect for the chaine of the cold of dairy products; 4) The deposits of carbonated drinks are not clean.

Conclusion: The failure to respect the storage conditions of the packed food can pull a change of the role of the packaging: of protector with the risk factor. The contents can deteriorate on the organoleptic plan and/or can become toxic. Conditions of storage and transport of foodstuffs have to be the object of information to be spread (broadcasted) with all the concerned. The Algerian legislation on the subject exists, it remains to make her known and especially to make her apply.

Key words: Packaging, storage, quality, Algerian legislation, Batna.

PO3208

AN UNDERUTILISED FRUIT OF MANGIFERA PAJANG KOSTERMANS INCREASES ANTIOXIDANT STATUS IN PLASMA OF NORMOCHOLESTEROLEMIC SUBJECTS

M. Ibrahim[1], A. Ismail[2], A. Azlan[3], A. Abd-Hamid[4]

[1]Department of Nutrition Sciences, Kulliyyah of Allied Health Sciences, International Islamic University Malaysia, Jalan Istana, Bandar Indera Mahkota, Kuantan, Pahang, Malaysia
[2]Department of Nutrition and Dietetics, Faculty of Medicine and Health Sciences, Universiti Putra Malaysia, Serdang, Selangor, Malaysia
[3]Department of Nutrition and Dietetics, Faculty of Medicine and Health Sciences, Universiti Putra Malaysia, Serdang, Selangor, Malaysia
[4]Department of Food Science, Faculty of Food Science and Technology, Universiti Putra Malaysia, Serdang, Selangor, Malaysia

Background and Objectives: Bambangan (Mangifera pajang) is a type of wild mango from family of Anacardiaceae, an under-utilised fruit that can be found in their native area such as East Kalimantan (Indonesia) and Borneo Island (Malaysia-Sabah and Sarawak; Brunei). The fruit is three times larger than commercial mango (Mangifera indica). The fruit is edible and constitutes one of the common dishes within the local community. The aim of this study was to determine the effect of bambangan juice powder (BJP) drink on plasma vitamins, antioxidant enzymes and together with the liver and kidney function tests.

Methods: A 4-week single-blinded, cross over supplementation trial was conducted. Subjects were randomly assigned to consume daily 250 mL of the study beverage, either flavoured mango juice (placebo group, n=16) or BJP juice (n=16). Thirty two healthy participants aged 24 – 28 years were recruited. Blood samples were drawn at the baseline (weeks 0, 4, 5 and 9) for enzymes and vitamin antioxidant determinations. For statistical analysis, general linear model were used to examine differences in post-intervention values compared to baseline values using Tukey's procedure for comparison of means.

Results: Compared with placebo, consumption of BJP drink increased the concentration of plasma β-carotene and ascorbic acid significantly at the end of the study. Plasma total antioxidant status tended to be greater after consumption of BJP drink than placebo drink. Plasma liver and kidney function tests were unaffected.

Conclusion: Consumption with BJP drink in healthy human volunteers improved non-enzymatic antioxidants. Total antioxidant status significantly increased due to the consumption of the test drink. Therefore, the consumption of BJP drink high in antioxidant may provide benefits in improving the antioxidant status in healthy volunteers.

Key words: Mangifera pajang; total antioxidant status; enzymes; function test.

PO3209

IDENTIFYING SUSTAINABLE FOODS COMBINING LOW ENVIRONMENTAL IMPACT, HIGH NUTRITIONAL QUALITY, AND MODERATE PRICE

G. Masset[1], L G. Soler[2], F. Vieux[1], N. Darmon[1]

[1]UMR NORT (Nutrition, Obésité et Risque Thrombotique) INRA1260, INSERM 1062, Aix-Marseille Université, Marseille, France
[2]INRA UR 1303 "Alimentation et sciences sociales (Aliss)", Ivry sur Seine, France

Background and Objetive: To help consumers achieve 'sustainable diets', i.e. environmental-friendly and healthy at a moderate cost, "sustainable foods" need to be identified. Yet, no guidance is given by official recommendations. We aimed to assess the associations between environmental impact, nutritional quality, and price of individual foods, and to identify foods with compatible sustainability constraints.

Methods: For 363 foods selected among those most consumed by French INCA2 dietary survey participants, environmental impact indicators (greenhouse gases emissions—GHGE—, acidification, eutrophication) and prices were collected. The British Ofcom nutrient profiling model was used to assess foods' nutritional quality. "Sustainable foods" were identified by selecting Ofcom model "healthier" foods which also had their GHGE and price under the overall median.

Results: All environmental indicators were highly correlated together. Meat, fish, eggs (MFE) and dairy products were the least environmental-friendly foods; starchy foods, legumes, and fruit and vegetables (F&V) were the most environmental-friendly. GHGE were inversely correlated to Ofcom score (r=-0.45) and positively to price/kg (r=0.60), correlation was null with price/kcal. Most within-food groups correlations followed these trends, showing that environmental friendly foods tended to have a higher nutritional quality and a lower price/kg, but not a lower price/kcal. Trends were strongest among starchy foods (including legumes) and dairy products. Healthier MFE products did not have higher GHGE. Using price/kg, 90 foods were identified as sustainable, of which most F&V and no MFE. Using price/kcal restricted the list to 39 foods, of which 54% of all starchy foods, 80% of legumes, but only 15% of F&V (mainly 100% fruit juices and processed fruit with added sugars).

Conclusions: The sustainability dimensions were suggested to be compatible when considering price/kg, but not when considering price/kcal. Integrating the present data at diet level could help to design sustainable diets.

Key words: Sustainable diets; greenhouse gas emissions; food price; nutrient profiling.

PO3210

EVALUATION OF THE QUALITY OF BREAD SAMPLES PRODUCED FROM WHEAT (TRITICUM AESTIVUM) AND UNRIPE PLANTAIN (MUSA PRADISIACA) COMPOSITE FLOURS

I. Williams[1], I. Ezeche[1], G. Igile[1]

[1]University of Calabar , Calabar, Nigeria

Background and Objectives: The Nigerian climate does not favour wheat farming. Thus Nigeria depends wholly on wheat importation for bread making which is an economic burden on the government necessitating the search for substitutes such as plantain flour. This study was designed to evaluate the nutritional, sensory and microbiological qualities of wheat and plantain composite flour bread.

Methods: Plantain was substituted in wheat flour at 3 levels (20%, 30%, 50%). Other ingredients were added to produce bread. Proximate composition, minerals and vitamins in the baked bread were determined by standard AOAC methods. Acceptability was assessed using an experienced taste panel. Storage stability was monitored through 7 days at ambient conditions.

Results: The 20/80 blend gave 10.47±0.05% protein compared to 30/70 and 50/50 blends which gave 8.99±0.02% and 8.25±0.06% protein contents, respectively. Whole wheat bread gave 11.96±0.02% protein which was significantly higher ($p<0.05$) than the blends. Fat content in 20/80 and 30/70 blends (1.26±0.02 and 1.32±0.05) compared favourably with whole wheat bread (1.39±0.02%). Significant increase ($p<0.05$) in ash contents of 20%, 30% and 50% substitutions were 1.62±0.01, 1.55±0.02 and 1.42±0.06% respectively, compared to the value in whole wheat bread (0.61±0.02%). Crude fibre contents of substituted samples were within the same range (1.88±0.12 – 2.02±0.15%) and were significantly lower than that of whole wheat (2.55±0.05%). Vitamin C in unripe plantain flour (2.50±0.05 mg/100g) contributed to the significantly ($p<0.05$) higher values in the blends as it was not detected in the whole wheat bread. Wheat/plantain blends showed better stability. Taste panelists accepted 30/70 and 20/80 blend ratios, but disliked whole plantain and 50/50 blend bread on account of colour and taste.

Conclusions: 20 – 30% plantain flour can be substituted in wheat flour for bread making to promote food security and sustainability.

Key words: Wheat, plantain, flour, evaluation, sustainability.

PO3211

ASSESSMENT AND COMPARISON OF FLAVONOIDS CONTENT OF CALENDULA OFFICIANIALIS CULTIVATED BY DIFFERENT LEVELS OF COMPOST AND NITROGEN FERTILIZERS

A. Rezazadeh[1], P. Farahpour[1], A. Rezazadeh[2,3], M. Sam Daliri[1]

[1]Departement of Agriculture, Azad University of Chalous, Chalous, Iran

[2]Students Research Committee, Shahid Beheshti University of Medical Sciences and Health Services, Tehran, Iran

[3]Community Nutrition Departement, Faculty of Nutrition and Food Technology, Shahid Beheshti, Tehran, Iran

Background and Objectives: Calendula (C. officinalis) extracts have shown anti-inflammatory, anti-viral, anti-genotoxic, anti anti-tumor and hemolytic effects. The therapeutic effects of Calendula is mainly attributed to it`s flavonoids including carotinoids, triterpene, saponins, and several associated compounds. The aim of this study is to define and compare the flavonoid content of calendula flowers cultivated by different levels of compost and nitrogen fertilizers in north farms of Iran.

Methods: This study was conducted in research farms of Islamic Azad University of Mazandaran, Chalous branch in 2011-2012. Factorial experiment was used in a randomized complete block design with three replications. These factors include the level of compost (not used: C0, C1: 6 and C2: 12 ton/hectare) and the levels of nitrogen fertilizer(not used: N0, N1; 50 and N2: 100 ton/hectare). Flavonoids content of Calendula was determined by HPLC–UV–MS method.

Results: Flavonoid content was affected by the impact of simple and interactive treatment. The maximum amount of flavonoid extract was obtained by the N0C2 (with maximum amount of compost used) treatment (0.66 µg/ml); and, the lowest content of flavonoids was extracted in the control (N0C0) blocks (0.53 µg/ml). The difference was significant ($p<0.05$). Also, the trend of change in flavonoid content was significantly decreasing along with increasing amount of nitrogen fertilizer from 0 to 100 tons/hectare and it was significantly increasing along with increasing amounts of compost from 0 to 6 tons/hectare ($p<0.001$).

Conclusions: Our findings suggest that flavonoids content of Calendula was increased by N0C2 treatment, indicating that using compost led to higher flavonoid levels than nitrogen fertilizer. Therefore, using compost fertilizer should be advised for industrial cultivation of Calendula.

Key Words: Calendula officinalis, Flavonoid, Compost, Nitrogen, Iran.

PO3212

ASSESSMENT OF THE NITROGEN AND COMPOST DIFFERENT LEVELS EFFECTS ON QUALITATIVE PERFORMANCE OF CALENDULA OFFICIANIALIS

A. Rezazadeh[1], P. farahpour[1], M. Sam Daliri[1]

[1]Faculty of Agriculture, Azad University of Chalous, Chalous, Iran

Background and Objective: Calendula (C. officinalis) has various health benefits and it is wildly used in different health related products. Due to the lucrative nature of this plant, increasing extraction of Calendula per hectare was emphasized by authorities. So, the aim of this study is to investigate the effects of nitrogen and compost different levels on quantitative performance of Calendula officinalis L. herb.

Methods: an experiment was carried out in the research field of Chalous Azad University in 2011-2012. The experiment was done in factorial form as a randomized complete block design, in three replicates. Treatments consisted of nitrogen and compost. Considered nitrogen levels consisted of N0= 0, N1=50, N2=100 kg/ha and compost levels were including C0=0, C1=6, C2=12 ton/ha. Investigated characteristics consisted of flower dry weight, number of flowers in plant, and flower diameter.

Results: Compost treatments had statistically significant influence ($p \leq 0.01$) on studied characteristics. Flower dry weight, flower diameter and number of flower in plant characteristics has been studied in eight harvest; as, the performance of these characteristics had increasing procedure from the first harvest up to the forth harvest; and, in the forth harvest, it has reached to its` maximum level and from fifth harvest, it had decreasing procedure. As, up to the forth harvest, the maximum flower dry weight, flower diameter and number of flower in plant obtained by C1XN2 (C1=6 ton/ha compost and N2=100 kg/ha nitrogen) treatment and from fifth up to the eighth harvest, it was obtained by C2XN2 (C2=12 ton/ha compost and N2=100 kg/ha nitrogen) treatment.

Conclusions: application of compost as a biological fertilizer plays an effective role in enhancement of quantitative performance of the plant.

Key words: Calendula officinalis, Compost, Nitrogen, Quantitative Performance.

PO3213

ASSESSMENT OF DIFFERENT PLANT DENSITY AND ARRANGEMENTS ON QUANTITATIVE AND QUALITATIVE PERFORMANCE OF CALENDULA OFFICIANIALIS

P. Farahpour[1], A. Rezazadeh[1], M. Sam Daliri[1]

[1]Faculty of Agriculture, Azad University of Chalous, Chalous, Iran

Background and Objectives: Calendula (C. officinalis) has various health benefits and it is wildly used in different health related products. Due to the lucrative nature of this plant, increasing extraction of Calendula per hectare was emphasized by authorities. The aim of this study was to determine convenient plant density and arrangement on quantitative and qualitative performance of calendula officinalis L. herb.

Methods: The experiment was carried out in research field of Soha Jisa agro-industry corporation in 2011-2012. Applied experimental design, was factorial design in the form of randomized complete block design with three replicates. Experimental treatments have been consisted of the distance between the row in two levels of R1=30 cm, R2=40 cm and the distance on the row in three levels of I1=10 cm, I2=20 cm, I3=30 cm and the cultivation method in two levels of P1=rectangular and P2=zigzag. Studied characteristics consisted of the number of flowers in plant, flower dry weight, flower diameter size and flavonoid content.

Results: the plant density and arrangement had significant effect at 1% ($p \leq 0.01$) and 5% ($p < 0.05$) level on the number of flowers in plant, flower dry weight, flower diameter size and flavonoid content. Also the maximum number of flowers in plant and maximum flower dry weight obtained in 30 cm distance between the row and 20 cm distance on the row treatment and zigzag cultivation method (R1XI2XP2). As, maximum flower diameter size and flavonoid content obtained in 30 cm distance between the row and 30 cm distance on the row treatment and zigzag cultivation method (R1_I3_P2).

Conclusions: findings revealed that plant density and arrangement method had significant effect on quantitative and qualitative performance of calendula officinalis L. herb.

Key words: Calendula officinalis, Plant density, Arrangement, Quantitative and Qualitative, Performance.

PO3214

THE POINT ON THE HEALTH CLAIM FOR OLIVE OIL: A MODEL SYSTEM TESTED TO MEASURE THE POLYPHENOLS CONTENT

E. Valli[1,2], G. Di Lecce[2], A. Bendini[1,2], T. Gallina Toschi[1,2]

[1]Inter-Departmental Centre for Agri-Food Industrial Research, Alma Mater Studiorum- University of Bologna, Cesena, Italy
[2]Department of Agricultural and Food Sciences, Alma Mater Studiorum- University of Bologna, Cesena, Italy

Background and Objectives: For olive oils, the EU Reg. 432/2012 introduced the possibility to report the health claim "Olive oil polyphenols contribute to the protection of blood lipids from oxidative stress" in the label, if the product contains at least 5 mg of hydroxytyrosol and its derivatives (e.g. oleuropein complex and tyrosol) per 20 g of product. As reported in previous investigations, such a claim is rather confusing because of the method for the quantification of secoiridoid aglycons. The aim of this work was to find a method for improving the estimation of the hydroxytyrosol and its derivatives content in olive oil, also taking in consideration previous experiences, as requested by the EU regulation.

Methods: Several basic and acid hydrolytic tests were performed both on the phenolic exctracts obtained from olive oils and on modelled reference standards (oleuropein), in order to have a complete lysis of the ester bond of the secoiridoids with a liberation of hydroxytyrosol and tyrosol, confirmed by HPLC-UV/MS analysis. A fast specific spectrophotometric method was also carried out for the quantification of such compounds.

Results: Since the basic treatment lead to the formation of congeners, acid hydrolysis of the phenolic extracts was the best compromise. On a model system, containing standard phenols, good correlation and linearity (r2= 0.999) between the concentrations of reagent and products were obtained. Encouraging results were also found by spectrophotometric assay.

Conclusions: The quantification of hydroxytyrosol and tyrosol obtained by hydrolysis of the phenolic compounds is a way for establishing the compliance with the health claim. A validation of the method will be essential and all the tests have to be confirmed by using olive oils characterized by a wide range of phenols amount.

Key words: Olive oil, phenols, health claim.

PO3215

THE PRESENCE OF AFLATOXINS IN PLANTS FOR INFUSION BEVERAGES

R M. Melo[1], L R. Aguiar[1], A C V. Moraes[1], A L A. Brandão[1], F. Poltronieri[2], A M. Silva[1], L M. Ribeiro Neto[1]

[1]Faculdade de Farmácia, Centro Universitário São Camilo, São Paulo, Brasil
[2]Faculdade de Nutrição, Centro Universitário São Camilo, São Paulo, Brasil

Background and Objectives: The plants used to prepare infusion beverages are sold in Brazilian street markets. It is important to research the presence of mycotoxins in plants to verify their sanitary quality, because of the Brazilian climate. The high temperature and humidity could favor the growth of fungi and the production of mycotoxins. Aflatoxins (B1, B2, G1 and G2) represent a major class of mycotoxins and are produced mainly by Aspergillus flavus and Aspergillus parasiticus. The toxic effects of aflatoxins are related to immunosuppressive, mutagenic, teratogenic and hepatocarcinogenic activities. The objective of this work was to investigate the occurrence of aflatoxins in plants commercialized in street markets of the city of São Paulo, Brazil.

Methods: It was purchased 100g of each plant: Matricaria chamomilla, Cymbopogon citratus, Peumus boldus, Achyrocline satureioides, and Mentha pulegium. About 50g of each crushed herbs were prepared and analyzed according to the method proposed by the American Pharmacopoeia (USP 32). This method was based on liquid-liquid extraction with organic solvents associated with subsequent purification of the extracts. The residues were obtained from the extracts and analyzed by thin layer chromatography with aflatoxin standard solution and developed for a distance of 15cm. The mobile phase used was chloroform-acetone-isopropanol (85:10:5, v/v/v). The toxins were visualized in ultraviolet light (UV) at 365nm. Aflatoxins B1, B2, G1 and G2 showed, respectively, RF 79, 75, 71 and 70 and the characteristic fluorescence was observed in UV.

Results: The analysis of samples from Matricaria chamomilla, Cymbopogon citratus, Achyrocline satureioides suggested the presence of aflatoxin B. Peumus boldus and Mentha pulegium extracts showed no typical aflatoxins stain under the analytical conditions used in this research.

Conclusions: Considering that was found aflatoxins in 60% of the plants analyzed, these products frequently should be submitted to the sanitary surveillance to avoid problem health in Brazilian consumers.

Key words: Toxicology, Aflatoxin, Plants, Beverage.

PO3216

SOY-BASED PROCESSED FOOD: A HEALTH RISK?

A L A. Brandão[1], M S B. Costa[1], J P. Vieira[1], L M. Ribeiro Neto[1], F. Poltronieri[2], A M. Silva[1], I T N. Verreschi[3]

[1]Faculdade de Farmácia, Centro Universitário São Camilo, São Paulo, Brasil
[2]Faculdade de Nutrição, Centro Universitário São Camilo, São Paulo, Brasil
[3]Departamento de Medicina, Universidade Federal de São Paulo - UNIFESP, São Paulo, Brasil

Background and Objectives: Soybean is a source of isoflavones phytoestrogens and their biological effects and relevance to human health were related to the alternative hormone replacement therapy, serum cholesterol concentration control and breast cancer prevention. However, the phytoestrogens could play as endocrine disrupters (ED), triggering off sexual precocity in children. The objective of this work was to evaluate the label information of soy-based processed foods about the risks and benefits of their consumption.

Methods: It was analyzed 41 labels of different processed foods containing soybean marketed in Brazil such as: cereal bars, cookies, hamburgers, margarines, cakes, green tea with soy, fruit juice with soy, soymilk powder, soy-based beverages.

Results: All labels evaluated had information about the benefits of these foods. But there was no warning about the possible health injury, if children, pregnant and lactating women had high consumption of isoflavones. Although the scientific literature indicated the correlation between consumption of foods with phytoestrogens and endocrine disruption in children, there was no legislation in Brazil to regulate this warning on food labels.

Conclusions: Therefore, the issues of soy-based processed foods should be considered by the food safety to ensure the health of consumers, especially the pediatric population and pregnant women.

Key words: Isoflavone. Endocrine disrupter. Precocity sexual. Food labeling.

PO3217

DEVELOPMENT OF HEALTHIER MUFFINS BY REDUCING THE CONTENT OF FAT AND SUGAR AND INCRESING FIBRE

G. Doménech-Asensi[1], A. López-Fernández[1], M. Santaella-Pascual[1], C. Frontela-Saseta[1], G. Ros-Berruezo[1]

[1]Department of Food Science and Nutrition, Faculty of Veterinary Sciences, University of Mucia, Murcia, Spain

Background and Objectives: Bakery products are widely consumed in the mediterranean diet, especially by children and adolescents. However, products such as muffins have also been associated with high consumption of simple sugars, saturated fat and a higher intake of energy. The aim of this study was to modify the nutritional profile of muffins by reduction and replacement of fat, reduction of simple sugars and addition of inulin as source of fibre in order to make them healthier, without decreasing the sensory quality.

Methods: The nutritional composition of muffins elaborated with wheat flour, sunflower oil, sugar, eggs and water was analyzed. Sunflower oil was replaced by "high oleic sunflower oil" (HOSO) and reduced its content by 54%. Simple sugars content was reduced by 68%. Chicory inulin, due to its textural properties and partial sweetness, was added in order to increase fiber content and as an alternative to fat and sugar. Proximate analysis was determined by AOAC methods, fatty acid profile by GC and simple sugars by HPLC. Sensorial studies were developed with 71 consumers.

Results: After recipe modification, total fat was reduced from 12.7% to 5.8%; saturated fats were reduced from 1.9% to 0.9%; monounsaturated fats increased from 3.7% to 4.1%; simple sugars were reduced from 23,3% to 7,5%, meanwhile fibre content increased from 2,5% to 8.2%. Total energy decreased from 352.5 to 258.7 Kcal/100g and cholesterol-saturated fat index was also reduced from 4.3 to 3.3. Sensorial test showed a good preference (35% of consumers) for modified muffins while purchase interest showed 62% vs 70% for modified and original muffins respectively.

Conclusion: Replacement of sunflower oil by HOSO, reduction of fat and sugar and addition of inulin are an adequate strategy to develop healthier muffins without affecting sensorial quality.

Key words: Healthy, muffins, inulin, fat, sugar.

PO3218

EVALUATION OF PLASMA TRIGLYCERIDE LEVELS IN RATS AFTER INGESTION OF BAKERY PRODUCTS WITH REDUCED-FAT CONTENT

G. Doménech-Asensi[1], N. Merola[1], C. Frontela-Saseta[1], G. Ros-Berruezo[1]

[1]Department of Food Science and Nutrition, Faculty of Veterinary Sciences, University of Mucia, Murcia, Spain

Background and Objectives: Fat oral test (FOT) has been described as a good technique to assess how different diets could affect plasma triglyceride (TAG) levels on rat as biomodel. The aim of this study was to determine changes in plasma TAG levels in rats after ingestion of bakery products which had been modified reducing fat levels in order to develop healthier products.

Methods: Four bakery products (cookies, sponge cake, croissant and muffins) before and after reducing the fat content were analyzed using the FOT. 48 Wistar rats were used in the study. Fat content was reduced in cookies from 16.5% to 14.8%; in sponge cake from 8.4% to 4.3%; in croissant from 23.8% to 20.6%, and in muffins from 12.7% to 5.8%. Blood samples were collected at 60, 120, 165 and 210 minutes. Statistical analysis was performed by Student's unpaired t-test. A p-value of <0.05 was considered statistically significant.

Results: In all cases, modified products showed plasma TAG levels lower than original products. Statistical differences were observed after ingestion of cookies at 60, 165 and 210 minutes; in sponge cake at all times; in croissant at 120, 165 and 210 minutes, and in muffins at 60 and 165 minutes.

Conclusion: FOT is a good technique to determine plasma TAG levels after consumption of bakery products. It is also useful to evaluate effects in plasma TAG levels after reduction of total fat content of ingested products.

Key words: Bakery products, healthy, fat oral test, triglycerides.

PO3219

PACKAGE INSERTS HERBAL DRUGS CONTAINING SOYBEAN ISOFLAVONES: TOXICOLOGICAL INFORMATIONS

J P. Vieira[1], A L A. Brandão[1], L M. Ribeiro Neto[1], F. Poltronieri[2], A M. Silva[1]

[1]Faculdade de Farmácia, Centro Universitário São Camilo, Sao Paulo, Brazil
[2]Faculdade de Nutrição, Centro Universitário São Camilo, São Paulo, Brazil

Background and Objectives: Herbal medicines, in Brazil, are regulated as conventional drugs that should provide similar criteria of quality, safety and efficacy required by the National Sanitary Surveillance Agency (ANVISA), included the correct package inserts information. In recent years, the evidence of the beneficial of isoflavones as alternative hormone replacement therapy without risks has favoured the increase of the consumption of this natural phytoestrogen. However, its abuse as a natural product could produce health injury. The objective of this work was to evaluate the package inserts information of soy-based herbal medicines about the risks and toxic effects described in scientific literature.

Methods: The package inserts were obtained from the isoflavone herbal medicines marketed in Brazil. The following information was analyzed based on the current package inserts legislation: drug name, manufacturer, composition, dosage, indication, contraindications and adverse reactions. It was included in this study the herbal medicines officially registered in Brazil, during the period of 2011-2012.

Results: A total of seven package inserts soy-based herbal medicines were analysed. All package inserts informed that the product could not be consumed by pregnant women, nursing mothers, and children or in cases of hypersensitivity to soya. Only 5 of 7 package inserts (71.4%) had the information about contraindications and/or adverse effects. About 28.6% mentioned the possibility of adverse effects on the reproductive system and 42.9% indicated the possibility of allergic reactions.

Conclusion: The lack of toxicological information in package inserts of herbal medicines evaluated in this work could damage the health consumers.

Key words: Herbal Medicines. Soy isoflavone. Package Inserts.

PO3220

DETERMINATION OF TOTAL NITROGEN IN PARENTERAL NUTRITION SOLUTIONS FOR MICRO-KJELDAHL METHOD

D. Freitas[1], R S R C. Capuchinho[1], I R. Santos[1], A M. Silva[1], M L M. Marin[1]

[1]Faculdade de Farmácia, Centro Universitário São Camilo, Natal, Brasil

Background and Objectives: Parenteral nutrition is indicated to meet the nutritional and metabolic needs of patients who can not be fed by mouth or enteral feeding. They are composed of macronutrients (carbohydrates, lipids, proteins), micronutrients (vitamins, electrolytes, trace elements) and water. According to the macronutrients in its composition, parenteral nutrition is classified as: 2 in 1 (carbohydrates and proteins) and 3 in 1 (carbohydrates, lipids and proteins). The protein nitrogen sources are essential to all living cells and responsible for many body physiological functions. The objective of this study was to determine the nitrogen content by micro-Kjeldahl method, based on the amino acids present in samples of different formulations of parenteral nutrition manipulated in a public hospital of São Paulo, Brazil. The micro-Kjeldahl method consisted in displacing nitrogen present in the sample, using sulfuric acid and hot digestion. The nitrogen presented, after the digestion, as ammonium sulfate was displaced using sodium hydroxide; and the ammonia obtained was received in boric acid solution. The titration with hydrochloric acid determined the amount of nitrogen in the samples. It was analyzed four different parenteral nutrition formulations 2 in 1, in quatriplicate: two samples of 500mL of parenteral nutrition with 20 amino acid and two samples of 500mL parenteral nutrition without amino acids. The 10% amino acid solution was used as standard. The precision and accuracy parameters were used to evaluate the reliability of the results. The levels of accuracy were 92.24% for parenteral nutrition without amino acid, 95.79% for parenteral nutrition with 20 amino acids and 91.55% for stander amino acid solution. It could be concluded that the micro-Kjeldahl method is simple, fast, accurate and reliable to the determinate nitrogen in parenteral nutrition solutions.

Key words: Parenteral. Solution Nitrogen. Reproducibility of results.

PO3221

EFFECT OF SPROUTING AND TEMPERATURE ON CRUDIVORISM DIET

C. Bonfanti Fiori[1], S. Guidolin Canniatti Brazaca[1]

[1]Department of Agro-industry, Foods and Nutrition of the Higher School of Agriculture "Luiz de Queiroz", University of São Paulo, Piracicaba, São Paulo, Brazil

Background and Objective: The objective of the present study was to verify the nutritional adequacy of a crudivorism diet consisting of sprouted grains and submit at three distinct temperatures.

Methods: The preparation of diets and chemical analyses were carried out in the Department of Agro-industry, Foods and Nutrition of the Higher School of Agriculture "Luiz de Queiroz" – University of São Paulo, Piracicaba, São Paulo, Brazil. A basic diet was prepared for the study consisting of unpeeled potato, raw red tomato, raw kale and lime bought in a local grocery store. Sprouted lentils or lentils were added to this basic diet in addition to sprouted peanuts or olive oil, totaling 4 experimental diets. The centesimal composition analyses which: moisture, ashes, protein, fat, insoluble fiber, soluble fiber were done according to the methodology described by the Association of Official Analytical Chemists (AOAC, 1995). Carbohydrate and calorie values were determined by calculations obtained from other analyses.

Results: The compounds foods in the diet crudivora are consumed essencial in natura or subjected to 40°C. Analyzing the effect of temperature on the composition of the diets crudívoras can check lower content of nutrients in diets subjected to 100°C, except for insoluble fiber that the highest content were observed at this temperature. Regarding the interference of sprouted grains, nutrient content did not differ between diets. What can be seen was a small decrease in the content of protein, carbohydrates and calories when added sprouted lentils. And small increase in ash content, fat, insoluble fiber and soluble fiber after the process of grain germination.

Conclusion: The temperature and grain germination can interfere with contents of nutrients analyzed. This must be taken into account in the diet to ensure proper nutritional support to these adepts.

Key words: Crudivorism, temperature and germination.

PO3222

THE INCREASING ROLE OF AQUACULTURE IN PROTEIN SUPPLY: CAN WE MAKE IT ENVIRONMENTALLY SUSTAINABLE?

J. Dias[1], L. Conceição[1], M T. Dinis[2]

[1]SPAROS Lda., CRIA, Universidade do Algarve, Faro, Portugal

[2]CCMAR, Aquaculture Research Group, University of Algarve, Faro, Portugal

Background and Objective: Fish are a valuable source of nutrients and globally, it provides about three billion people with almost 20 percent of their average per capita intake of animal protein. By 2050 the world's population is predicted to rise to 9.3 billion. Animal production and agriculture require arable land and fresh water, both of which are in short supply. Increased fishing doesn't seem to be a viable option as wild fish populations are close to their maximum fishing yields.

Methods and Results: Aquaculture has been the fastest growing animal food production globally for the last 3 decades, with production (excluding aquatic plants) growing at an average rate of 8.1% per year since 1981 (compared with 3.0% for terrestrial farmed meat production). Aquaculture now accounts for nearly half of the world's food fish. By FAO's estimate, in 2050 the demand for seafood products could only be satisfied if aquaculture doubled its current production. Commercial aquaculture development invariably involves the expansion of cultivated areas, higher density of aquaculture installations and the use of biologic and feed resources produced outside the immediate area. All these practices can have an aggregated effect at the ecosystem level and compromise its overall integrity. Fuel such a tremendous growth of the aquaculture sector without compromising the environment is a major sustainability challenge.

Conclusion: Research can play a pivotal role in defining the future trends governing the sustainable growth of aquaculture. Knowledge on the implementation of new production systems and technologies (e.g. water recirculation, integrated multitrophic, aquaponics, off-shore); the farming of new species positioned at lower levels of the food web; enhancing the use of alternative feed resources; the integration of high welfare status as a health management tool; and the use of biotechnology advances is generating valid solutions to enhance aquaculture productivity at lower environmental costs.

Key words: Aquaculture, sustainability, environment.

PO3223

BEST PRACTICES IN BENEFIT-RISK ANALYSIS IN FOOD, NUTRITION AND OTHER AREAS

H. Verhagen[1,2], M J. Tijhuis[1,3], H. Gunnlaugsdottir[4], N. Kalogeras[3], O. Leino[5], J M. Luteijn[2], S H. Magnússon[4], G. Odekerken[3], M V. Pohjola[5], J T. Tuomisto[5], Ø. Ueland[6], B C. White[2], F. Holm[7]

[1]RIVM, Bilthoven, The Netherlands

[2]University of Ulster, Coleraine, Northern-Ireland

[3]Maastricht University, Maastricht, The Netherlands

[4]Matis, Reijkjavik, Iceland

[5]THL, Kuopio, Finland

[6]Nofima Mat, As, Norway

[7]FoodGroup, Århus Area, Denmark

Background and Objectives: An integrated benefit–risk analysis (BRA) gives guidance in decision situations where benefits do not clearly prevail over risks. The BEPRARIBEAN project (Best Practices in Risk Benefit Analysis; http://en.opasnet.org/w/Bepraribean) investigated how BRA in food and nutrition could benefit from looking across its borders.

Methods: Commonalities and differences in BRA were identified between the Food and Nutrition field and other fields: Medicines, Food Microbiology, Environmental Health, Economics & Marketing–Finance, and Consumer Perception. Six state of the art papers in all these areas were produced, followed by an integration paper.

Results: Integrated BRA in Food and Nutrition may advance in the following ways: increased engagement and communication between assessors, managers, and stakeholders; more pragmatic problem-oriented framing of assessment; accepting some risk; pre- and post-market analysis; explicit communication of the assessment purpose, input and output; more human (dose–response) data and more efficient use of human data; segmenting populations based on physiology; explicit consideration of value judgments in assessment; integration of multiple benefits and risks from multiple domains; explicit recognition of the impact of consumer beliefs, opinions, views, perceptions, and attitudes on behaviour; and segmenting populations based on behaviour.

Conclusions: The opportunities proposed here do not provide ultimate solutions; rather, they define a collection of issues to be taken account of in developing methods, tools, practices and policies, as well as refining the regulatory context, for BRA in Food and Nutrition and other fields. These opportunities now need to be explored further and incorporated into benefit–risk practice and policy, thereby involving a paradigm shift in Food and Nutrition BRA towards conceiving the analysis as a process of creating shared knowledge among all stakeholders.

Key Words: Benefit-risk, Risk-benefit, Best practice, Bepraribean. Food and Chemical Toxicology, vol 50 (1), 2012.

PO3224

CAN FUNCTIONAL FOOD AND ORGANIC FOOD BE SUPPORTING CONCEPTS IN EUROPE?

S. Bügel[1], J. Kahl[2], A. Zalecka[3], A. Ploeger[2], M. Huber[4]

[1]Department of Nutrition, Exercise, and Sports, University of Copenhagen, Copenhagen, Denmark
[2]Department of Organic Food Quality and Food Culture, University of Kassel, Kassel, Germany
[3]Division of Organic Food, Warsaw University of Life Sciences, SGGW, Warsaw, Poland
[4]Louis Bolk Institute, Hoofdstraat LA Driebergen, The Netherlands

Background and Objective: Functional as well as organic food belong to fast growing segments of the European food market. Both are food according to the European food regulations. The question is whether organic food can also be a functional food?

Method: A review of recent literature regarding organic and functional food was conducted.

Results: Both organic and functional foods are regulated by the European food regulations, but organic food is further regulated by the European regulation for organic agriculture and food production. This regulation restricts the number of food additives and limits substantial changes in the food. This may cause problems in changing the food based on single constituents or attributes when applying the concept of functional food to organic food production. Claims of food related to positive health effects can only be accepted as true, when the claims have been tested and then validated by the EU-Commission. Whereas functional food focuses on product comparison based on specific constituents or attributes, organic food as a whole has no placebo for comparison, and effects on environment and society are not part of the health claim regulation. Therefore it seems rather difficult to establish health claims of organic foods. Consumers buy organic food out of an emotional attitude and associate the food with naturalness. In contrast, the decision for buying functional food is related to rationality, and consumer's associate functional food with a more technological approach.

Conclusion: In conclusion, the concept of functional food seems not to support organic food production in Europe.

Key words: Organic, functional, food, consumer, quality.

PO3225

IMPACTS OF THE WORLD GRAIN PRICE SPIKES IN 2008 ON THE UK HOUSEHOLDS

T. Tanaka[1,2], J. Macdiarmid[1,2], G. Horgan[1,3], P. Haggarty[1,2]

[1]Rowett Institute of Nutrition and Health, University of Aberdeen, Aberdeen, UK
[2]Public Health Nutrition Research Group, University of Aberdeen, Aberdeen, UK
[3]Biomathematics and Statistics Scotland (BioSS), Edinburgh, Scotland, UK

Background and Objetives: The global food price surges in 2008 not only expanded the world poverty population, but also degraded the living standard of the low-income class in developed nations. It was also reported that livestock sector struggled against expensive grain feed, and the increased oil price could push up grain production cost and its price, especially through fertiliser and transport. This paper examined the effects of the international grain price hikes on the UK households with different income levels, the degree of impacts of the grain price rises on meat and dairy prices in the UK, and the influence of the world oil price spike on UK grain prices and the consumption behaviour of the UK households. We also analysed national data on the actual change in household consumption of foods and nutrients at the time of the price spike. The implications of the food price spike for nutritional status by income group are discussed.

Methods: To answer these questions, we constructed a UK food computable general equilibrium (CGE) model incorporating five income level households. The data used are a social accounting matrix (SAM) built by the Global Trade Analysis Project (GTAP), elasticity information for food cited from Tiffin and Tiffin (1999), and nutrition information from the Department for Environment, Food and Rural Affairs (DEFRA). Results and

Conclusions: It is found that the lowest income household most suffered from the grain price increase, while other households were not negatively impacted in economic welfare, the prices of meat and dairy products marginally increased by the global grain price rises, and the oil price spike little lifted up the UK grain prices in nominal term, but pushed down in real term, since the change in oil price caused a larger price inflation than that in nominal grain price, which led most consumers to reducing grain consumption.

Key words: Food Security, International Trade, Energy Price, Public Health.

PO3226

ENVIRONMENTAL PREDICTORS OF FRUIT, VEGETABLE AND ANIMAL SOURCE FOOD CONSUMPTION IN THE EAST USAMBARA MOUNTAINS, TANZANIA

B. Powell[1,2], T. Johns[2], M. Oluoch[3], P. Maundu[4]

[1]Centre for International Forestry Research, Bogor, Indonesia
[2]School of Dietetics and Human Nutrition, McGill University, Montreal, Canada
[3]International Institute for Tropical Agriculture (IITA), Nigeria
[4]National Museum of Kenya, Nairobi, Kenya

Background and Objetive: There is increasing evidence that biodiversity is essential for human nutrition. The relationships between environmental variables linked to agriculture (acres farmed, number of fields, fallow, hours spent farming, crop diversity) and forests (forest cover and use) and consumption of nutrient-dense foods (fruits, vegetables and animal source foods (ASF)) was tested in a rural African community.

Methods: Data for 274 children approximately 2 - 5 years old was collected by 24 hour recall (quantity in grams) and modified 7 day food frequency questionnaire (diversity of fruits, vegetables and ASF). Multivariate regressions, controlling for child's age, sex, breastfeeding status and household wealth, were used to determine which environmental variables were predictors of each dependant variable (conditional stepwise addition).

Results: The quantity of vegetables consumed was positively associated with acres of fallow land, while higher vegetable diversity was associated with greater crop diversity. Diversity of fruits was higher in higher elevations and both higher diversity and higher quantity of fruit was predicted by a greater diversity of crops. Higher diversity of ASF was also associated with agricultural diversity. Greater intake of ASF (in grams) was predicted by having a higher amount of unprotected forest around home and the household having not visited a reserved forest in the past week (possibly an indication of participation in conservation and thus not hunting). Analyses for households found in the lowlands only (n=185), showed higher forest cover to be associated with great quantity of vegetables and ASF consumed by children.

Conclusions: In this setting, environmental factors associated with agriculture predict quantity and diversity of some nutritionally important foods, while factors associated with forests predict consumption of others. This suggests that local people draw on biodiversity from both farm and forest to enhance the nutrient-density of their diets.

Key Words: Farm, forest, nutrient-dense, micronutrient, Africa.

PO3227

MEAL TRANPORTATION: HOT CHAIN EVALUATION IN A BRASILIAN UNIVERSITARY RESTAURANT

M. Carneiro[1], R. Machado[1], L. Arararipe[1], L. Andrade[1]

[1]UFRJ - INJC , Rio de Janeiro, Brazil

Background and Objectives: The transportation system of meals characterized by the distance between the place of production and distribution of meals a facility to another. Meals transported require a strict quality control at all stages of the production process, to guarantee food safety. The risk of foodborne disease is further enhanced in that the preparations are distinguished by a production process where heavy handling process occurs and subsequently the preparation is consumed without reheating, with the aggravating the fact that the distance between the locations production and distribution of the same.

Methods: This study was in the Restaurant of the Federal University of Rio de Janeiro and aimed to verify the quality of supply of main course meals transported as standards on packaging and temperature on arrival at the distribution site for 4 months in the maximum time of 4 hours after production.

Results: The average temperature in filling the place of production was 85 °C and receiving the point of supply of 69 °C with a reduction in average temperature of 17 °C.

Conclusions: Even with loss during transport, the average temperature was kept still within acceptable values. Reviews in constant process transported meals need to be made, because the temperature is very important criterion in the assessment of food quality control.

Key words: Hot chain, temperature, meal transportation, catering.

PO3228

EFFECTS OF A HIGH-PROTEIN SOY DIET ON BRAIN OXIDATIVE STRESS IN RATS

D. Camiletti-Moirón[1], V A. Aparicio[1], E. Nebot[1], A. Andrade[1], G. Kapravelou[1], J M. Porres[1], M. López-Jurado[1], P. Aranda[1]

[1]Department of Physiology and Institute of Nutrition and Food Technology, Faculty of Pharmacy and School of Sport Sciences, University of Granada, Granada, Spain

Background and Objective: The use of high-protein (HP) diets is gaining in popularity in the general population, especially among people interested in weight loss. Recent studies

have showed beneficial effects of a HP diet on brain rodent. Therefore, we aimed to examine the effects of a HP diet based on soy protein on brain oxidative stress.

Methods: Eighty Wistar rats were randomly distributed in 2 experimental groups (n=40): normal-protein (NP) or HP diets based on soy-protein (SP), for an experimental period of 12 weeks. Brain total superoxide dismutase (SOD), manganese superoxide dismutase (Mn-SOD), cooper and zinc superoxide dismutase (CuZn-SOD) and catalase (CAT) activities were measured. Body weight was measured weekly for all animals at the same time and the amount of food consumed by each rat was registered daily.

Results: The experimental group fed with HP diet showed higher brain weight, total SOD, CuZn-SOD and CAT compared to the NP diet group (0.61±0.01 vs. 0.57±0.02 g/100 g body weight, respectively, $p<0.05$ for brain weight, 193.41 ± 5.81 vs. 178.07 ± 2.81 U/mg protein, respectively, $p<0.05$ for total SOD, 109.95 ± 5.02 vs. 94.13 ± 1.80 U/mg protein, respectively, $p<0.01$ for CuZn-SOD and 5.01 ± 0.20 vs. 4.35 ± 0.16 μmol H2O2 /min/mg protein, respectively, $p<0.05$ for CAT). On the other hand, the group fed the HP diet displayed lower food intake when compared to the NP group (15.39 ± 0.21 vs. 17.81 ± 0.36 g, respectively, $p<0.001$). No differences between groups were observed on final body weight, carcass weight, brain weight (g) and Mn-SOD (all, $p>0.05$).

Conclusions: A HP soy diet appears to induce antioxidant capacity when compared to a NP diet. Overall, a HP diet base on soy sources may benefit brain oxidative stress response. More studies are needed to confirm or contrast the present findings.

Key words: High-protein, soy-protein, superoxide dismutase, catalase, brain.

PO3229

NA, K, CA, MG, FE, MN, CU, ZN, CR AND MO IN ENERGY DRINKS: NUTRITIONAL EVALUATION

C. Rubio[1], A. Ravelo[1], A. Soler[1], A J. Gutiérrez[1], D. González Weller[1], A. Hardisson[1]

[1] Toxicology Department, University of La Laguna, 38071 La Laguna, S/C de Tenerife, Spain

Background and Objectives: Energy drinks are those with a high caffeine concentration (Â± 32 mg/ 100mL). The market for energy drinks grows exponentially, with young adults being the main consumers (19-25 years old). The aim of this study was to determine the concentrations of Na, K, Ca, Mg, Fe, Mn, Cu, Zn, Cr and Mo in these types of drinks and also to evaluate its contribution to the RDI established for the main consumer of the Spanish population.

Methods: A total of 50 energy drinks samples purchased in shops in Tenerife were analyzed. During the pretreatment the samples were degasified with ultrasounds (1-2 minutes). After having measured 25 mL of the degasified sample in porcelain porous crucibles, they were put in a heater (80ÂºC / 48h) then in a muffle oven (450 ÂºC / 48 h). The obtained ashes were diluted in HNO3 at 1.5 %, gauging in flasks of 50 mL. The metal determination was performed using the ICP-AES technique (Inductively coupled plasma atomic emission spectroscopy).

Results: Mean concentrations were: 370.42 mg/L of Na, 133.74 mg/L of K, 40.43 mg/L of Ca, 39.80 mg/L of Mg, 0.259 mg/L of Fe, 0.045 mg/L of Mn, 0.158 mg/L of Cu, 0.138 mg/L of Zn, 1.434 Âμg/L of Cr and 0.769 Âμg/L of Mo. Estimation and evaluation of a moderate consumption (1 can per day = 250 mL per day) of energy drinks leads to a contribution to the RDI for young male adults of: Na (6.17 %), Mg (2.84 %), Ca (1.12%) and K (1.08 %), Cu (3.59 %), Cr (1.02 %), Fe (0.72 %), Mn (0.49%), Mo (0.43%) and Zn (0.36 %).

Conclusions: Moderate consumption of energy drinks contribute in an important way to the ingestion of Na, Cu and Mg.

Key words: Energy drinks, Metals, RDI, ICP-AES.

PO3230

INFLUENCE OF CONDITIONS OF DAIRY BOVINE BREEDING ON THE QUALITY OF MILK

A. Mezdoud[1], F. Bekhouche[2]

[1] INATAA, University Mentouri Constantine, Cirta, Algeria

[2] INATAA, University Mentouri Constantine, Cirta, Algeria

Background and Objetive: In the present study, we defined the best practice in dairy breeding which are necessary to promote the quality of secured milk.

Methods: Three farms located in the willaya of Constantine have been concerned by the study of conduct of breeding and dairy production: the first farm is endowed with the necessary equipments in the smooth running of the breeding, while the two others have very restricted means. From this critical study, we have to propose a program of the best practice of breeding and hygiene adapted for every exploitation, in order to contribute to the improvement of the used system.

Results: The First farm possesses an organized management system with a good infrastructure. The staff charged of the herd is competent; which allows him to optimize the dairy production. However, for the two other farms, the conduct of breeding is realized with a precarious and elementary way, without focalizing the interest on the improvement. Our proposed program consists into 5 items: the health of the animal,

the site of accommodation, the environment, the food, the hygiene of the draft and the storage of the milk.

Conclusion: this study has allowed us to establish a diagnosis of the conditions of breeding in three farms, to estimate the met failures, and to contribute to the improvement of the conditions of breeding by the proposal of a program of best practice of breeding.

Key words: Survey, dairy cow, best practice of breeding, dairy bovine breeding.

PO3231

EVALUATING HYGIENE PRACTICES IN HOSPITAL FOOD SERVICES

A. Cardonha[1], L. Seabra[1], A. Nobre[1], G. Medeiros[1], P. Rolim[1], K. Damasceno[1]

[1]Department of Nutrition, Centre of Health Sciences, Federal University of Rio Grande do Norte, Natal, Brazil

Background and Objectives: The production of meals in hospital food services is indispensable in the recovery of patient's health status. Special care is required in order to avoid contaminated food, one of the main sources of hospital infection. The purpose of this study was to evaluate the hygiene practices of hospital food services in Natal, Rio Grande do Norte state, Brazil.

Methods: The study was conducted in three units, denominated A, B and C, and a checklist based on current Brazilian law was used to evaluate Good Hygiene Practices. Assessment was carried out in each unit, on three different days. Block weighting methodology, classifying the items as indispensable, necessary and advisable, was used to analyze the checklist. Units were classified as follows: 'Excellent', units scoring between 96 and 100 points; 'very good', from 89 to 95; 'good', from 76 to 88; 'fair', from 41 to 75 and 'poor', less than 41 points.

Results: The results obtained showed that the units analyzed follow some of the legal guidelines; however, Good Hygiene Practices still leave much to be desired. Assessment, which was based on the weighted score of the unit, revealed that units A, B and C obtained scores of 78.05, 74.58 and 68.33 points, respectively. Thus, unit A was classified as 'good' and units B and C as 'fair'.

Conclusions: The study demonstrates the need for better Food Hygiene Practices in hospitals, in order to prevent these units from becoming facilitator agents of hospital-based diseases or infections. These data show the importance of hygiene training and the application of Good Practices in these units.

Key words: Hospital food services, good hygiene practices, food safety.

PO3232

FOOD SAFETY AND NUTRITION KNOWLEDGE OF URBAN SCHOOL CHILDREN

H. Hardinsyah[1], C. Au[2], M. Lwin[3], C. Dwiriani[1], M. Aries[1], F. Dwiyanti[2]

[1]Food and Nutrition Society of Indonesia and Department of Community Nutrition, Bogor Agricultural University, Kampus IPB, Jl Raya Darmaga, Bogor, Indonesia

[2]Mondelçz Asia Pacific, Singapore and Kraft Foods, Indonesia

[3]Wee Kim Wee School of Communication and Information, Nanyang Technological University, Indonesia

Background and Objectives: In many urban developing countries, most school children (SC) purchase snacks at school; and often face problems of unsafe food, which may influence their health and learning process. Very limited studies and programs address food safety and nutrition together. This study assess problems of food safety knowledge (FK) and nutrition knowledge (NK) of urban elementery SC.

Methods: A survey was conducted with SC (n=524, 8–10 years old) from different socio-economic status (SES) in Jakarta and Bogor. Data were collected through both interview and record using a pre-tested questionnaire, include 15 items of FK and 15 items of NK which encompass hand washing, type of unsafe food, commonly hazardous substance, risk of unsafe food, balance diet, meal time, breakfast, snack, drink and examples of nutrients source foods. The cutoff point to define a problem of FK/NK is when the question corectly answered for at least 75%.

Results: Overall SC knowlwedge on food safety and nutrition was categorized as medium-low level (88.3%) with the mean score 72.3±11.4. The FK of SC (84.3±11.6) is better than their nutrition knowledge (60.4±14.8). The mean score of food safety knowledge in the high SES (89.5±6.8) is better than the low SES (79.2±13.). Similarly, the NK of the high SES (67.1±13.3) is better than the low SES (53.9±13.2). Three problems of FK were identified: safety of food contaminated by flies, use of food cooked in dark-brown oil, dark-brown used oil, and MSG; and eight problems of NK were identified: drink amount, breakfast benefits, nutritious snacks, nutrient groups, protein role, energy source, protein source and anemia.

Conclusions: There is a need to improve the food safety and nutrition knowledge of SC. There is potential for an effective food safety and nutrition education and other health interventions.

Key words: Food safety, nutrition knowledge, children.

PO3233

THE RELATION BETWEEN DIETARY HABITS AND URINARY LEVELS OF 3-PHENOXY BENZOIC ACID, A PYRETHROIDS METABOLITE

C R. Fortes[1], S. Mastroeni[1], M. Pilla[1], G. Antonelli[1], L. Lunghini[2], C. Aprea[2]

[1]Epidemioloia, Istituto Dermopatico dell'Immacolata, IDI-IRCCS, Rome, Italy
[2]Tossicologia Occupazionale e Ambientale Laboratorio di Sanit¨€ Pubblica Area Vasta Toscana Sud Est Azienda USL 7, Siena, Italy.

Background and Objectives: Concerns about pesticide exposure through food consumption have increased during the past several years. Pyrethroids are applied as insecticides throughout the world. Human metabolism of pyrethroids results in urinary metabolites that are suitable for biological monitoring. The objective of our study was to investigate the relation between food consumption and urinary levels of 3-phenoxybenzoic acid (3-PBA), a general metabolite of pyrethroids.

Methods: In a non-occupational exposed adult population from the IDI-IRCCS, Rome, Italy, information on socio-demographic characteristics, smoking, diet and self-reported household pesticide exposure was collected. Urinary 3-PBA level of each subject was measured and adjusted by urinary creatinine.
Results: We found that people consuming both raw and cooked vegetables five times weekly or more had higher mean levels of 3-PBA in urine (1.03 μg/g creatinine versus 0.52 μg/g creatinine; p=0.009 and 0.99 μg/g creatinine versus 0.58 μg/g creatinine; p=0.01 respectively) than subjects consuming less than five times weekly. In a multivariate model, after adjusting for age, sex, BMI, smoking and household insecticide exposure, high intake of raw vegetables (OR: 5.31; 95%CI: 1.32- 21.3) and high intake of cooked vegetables, in particular cruciferous (OR: 4.67; 95%CI: 1.07- 20.5) and leafy vegetables (OR: 6.88; 95%CI: 1.50- 31.7) were associated with high urine 3-PBA levels (≥ 0.70. μg/g creatinine).

Conclusions: The results of this study suggest that part of the variation in pyrethrois intake is explained by vegetable intake.

Key words: Diet, pesticides, 3-phenoxy benzoic acid.

PO3234

EFFECT OF NISIN ON BIOCHEMICAL PARAMETERS

E B. Giuntini[1,2], M L P A. Gomez[3], M C T. Dan[1], E W. Menezes[1,2], B D G M. Franco[1,2]

[1]Food and Nutrition Research Center/University of São Paulo (NAPAN/USP) and FoRC/CEPID/FAPESP, São Paulo, Brazil
[2]Department of Food and Experimental Nutrition, Faculty of Pharmaceutical Sciences (FCF), USP, Brazil
[3]Centro Universitário Italo-Brasileiro, São Paulo, Brazil

Background and Objectives: The use of antibiotics for improvements in animal health, food productivity, and microbial food safety is being gradually replaced by other alternatives with less adverse effects to human health, in line with the novel concept of biopreservation. Nisin is a bacteriocin that has been used as an alternative to the use of chemical conservatives in several food products, especially in cheese. Although nisin is recognized as safe and approved for use in food, there are a few studies concerning its effects on human organism. In the present work, we observed the influence of nisin intake on some biochemical parameters in healthy volunteers.

Methods: Volunteers of both genders were oriented to consume soup, supplemented (nisin group, n=12) or not (control group, n=16) with nisin (5.625 mg/person/day). They were oriented to consume the soup 3 times in each week, during six weeks. The levels of the biochemical markers of liver and kidney function alanin-aminotransferase (ALT), aspartate-aminotransferase (AST) and creatinine (CRE) were investigated, as well as the levels of plasma lipids cholesterol, high density lipoprotein (HDL), low-density lipoprotein (LDL), and triglycerides (TGR), before and after treatment.

Results: Results demonstrated that all parameters were under the recommended limits. When control and nisin groups were compared, there were no significant differences (p=0.05) in all parameters levels, except CRE. When comparing the levels before and after treatment with nisin, the HDL levels were higher and ALT levels were lower after the treatment (p=0.05).

Conclusions: These results confirm the concept that nisin is safe to human consume, since there is no harmful changes on biochemical parameters studied.

Key words: Nisin, Bacteriocins, Biochemical Parameters, Volunteers.

PO3235

INDICATORS OF NON-ENZYMATIC BROWNING IN THE EVALUATION OF HEAT DAMAGE AND AVAILABLE LYSINE CONTENT IN SPANISH COMMERCIAL INFANT FORMULAS

J. Contreras[1], E. Guerra[2], B. García[2]

[1]Department of Food, Faculty of Pharmaceutical Chemistry, University of Antioquia, City University, Medellín, Colombia

[2]Department of Nutrition and Food Science, Faculty of Pharmacy, University of Granada, Granada, Spain

Background and Objectives: The interactions between infant formula components (proteins, fats, carbohydrates, vitamin and minerals) mainly affect carbohydrates and proteins (Maillard reaction, MR), but those involving proteins are especially important in products used in infant feeding because of the high protein requirements of infants. Nonenzymatic browning reactions in 14 commercial powdered infant formulas (IF) (adapted, follow-up, hyperalergenic, and soybean-based) were evaluated. The objectives were to evaluate heat damage in commercial infant formulas by measuring the non-enzymatic browning indicators and to determine the nutritional value of these IF.

Methods: Furosine, HMF and furfural were studied as indicators of thermal damage and available lysine as nutritional indicator, determined by HPLC in phase reverse and UV detector.

Results: The values of furosine were very varied, being the minimal value for the IF 14 with proteins isolated of soy (79 mg/100 g of protein) and the maximum for the IF 3 with whey protein hydrolyzed (1459 mg/100 g of protein). The available lysine contents were low (1.88-3.87 g/100 g of protein). HMF and furfural contents ranged between 1.28-14.2 and 0.06-0.62 mg/Kg respectively.

Conclusions: Similar IF show varied heat damage and nutritional values. Between furosine and furfural was found a direct correlation for what these indicators are proposed as useful indicators to evaluate the heat damage in IF. All IF except one met the minimum requirements of lysine for a child of 3 months.

Key words: Infant formulas; furosine; HMF; furfural; available lysine.

Acknowledgements: This work was supported by a predoctoral fellowship obtained from the Junta de Andalucía (Spain).

PO3236

EFFICACY OF ZINC SUPPLEMENTATION ON IMPROVEMENT OF WEIGHT AND HEIGHT GROWTH OF HEALTHY 9-18 YEAR CHILDREN IN IRAN

F. Kaseb[1], R. Fallah[1]

[1]Yazd University of Medical Sciences, Yarz, Iran

Background and Objetive: As an essential micronutrient, zinc has a critical role in human growth in different stages of life. The purpose of this study was to evaluate the effect of zinc supplementation on weight and height growth of non-zinc-deficient healthy children.

Methods: A parallel single-blinded randomized clinical trial was conducted on 9-18 year old healthy referred children to Pediatric Clinic of Shahid Sadoughi Hospital, Yazd, Iran from April to October 2011. Children were randomly assigned to two groups to receive daily supplementation of single dose of 5 mg zinc sulfate supplementation for 4 months or placebo. The primary variables were weight gain velocity, height gain velocity and serum zinc level that were evaluated before and four months after intervention. Secondary variable was clinical side effects.

Results: 95 children including 48 girls and 47 boys with mean age of 12.2 ± 2.39 years were compared in two groups (zinc and placebo). Weight gain velocity (0.52±0.41 kg/month vs. 0.27±0.11 kg/month, p= 0.01) and height gain velocity (0.89±0.23 centimeter per month vs. 0.40±0.28 centimeter per month, p= 0.001) were higher in zinc group. Serum zinc level was not significantly different in both groups. Transient mild gastrointestinal side effects were seen in four children (8.3%) in zinc group and treatment was stopped in none of children who suffered from them.

Conclusion: Zinc supplementation can improve weight and height gain velocity of healthy 9-18 year-old children.

Key words: Zinc, Supplement, Height, Weight, Children.

PO3237

DIVERSITY OF VEGETABLES AVAILABLE IN BRAZILIAN HOUSEHOLDS: DATA FROM THE 2008-2009 HOUSEHOLD BUDGET SURVEY

R. Pereira[1], V. Marins[2], D. Minuzzo[2], I. Alves[1], G. Pereira[1], T. Vasconcelos[1], L. Monteiro[1]

[1]Departamento de Nutrição Social e Aplicada, Universidade Federal do Rio de Janeiro, Rio de Janeiro, Brazil

[2]Faculdade Arhur Sa Earp Neto, Petrópolis, Rio de Janeiro, Brazil

Background and Objective: Biodiversity loss and inadequate food consumption are critical challenges for decision-makers in food and nutrition policies. Reducing the rapid loss of biological diversity is considered essential for food security and sustainable food production. As part of a comprehensive project characterizing food biodiversity in Brazil, this study aimed to describe the diversity of vegetables available in the five Brazilian geographic regions.

Methods: Data came from the 2008-2009 nationwide Household Budget Survey. Household food availability was estimated for each Brazilian geographic region (North, Northeast, Southeast, South, and Central-Western). All fresh vegetables acquired were identified. Common and scientific names were described and weekly per capita mean amounts available were estimated.

Results: Eighty-four varieties of vegetables were available throughout Brazil. Fifty different varieties of vegetables were cited in the Northern and Northeastern regions; 53 in the Central-West, 55 in the South, and 65 in the Southeast; 35 varieties were common to all regions. The most cited vegetable was the tomato, followed by onion and lettuce. Some varieties were observed only in specific regions, for example, cassava leaves were available only in Central-Western households, sorrel (Rumex acetosa) and onion leaves were consumed exclusively in the Northeast, while asparagus and kohlrabi (Brassica oleracea var. gongylodes) were available solely in the South. In the Southeastern region nine exclusie vegetables were reported. In Brazil, total mean weekly per capita amount of vegetables availability was 11.4 kg; the tomato was the most consumed vegetable with a per capita weekly availability of about 0.5 kg.

Conclusion: The biodiversity of vegetables available in the Brazilian diet is limited, consequent to the reduced consumption of these foods in the country, and revealed by the high prevalence of inadequate intake of several vitamins and minerals observed in this population.

Key words: Food biodiversity, vegetables, Brazil, household expenditure survey.

PO3238

HUNGER IN THE MIDST OF PLENTY: THE NEED FOR PROMOTING NUTRITION THROUGH AGRICULTURE EXTENSION SERVICES

C. Nyhus Dhillon[1], K. Mosso[2], M. Haruni[1], V. Kamagenge[1], B. McIntyre[3]

[1]Helen Keller International, Tanzania

[2]Columbia Mailman School of Public Health, USA

[3]Helen Keller International Washington DC, USA

Background and Objetive: Tanzania's Lake Zone exhibits high household food and nutrition insecurity despite considerable arable land access. Helen Keller International's agriculture-focused nutrition program, Enhanced Homestead Food Production (EHFP), combines home gardening, poultry rearing and nutrition education to improve the nutritional status of women and children. A baseline survey was conducted to assess the nutritional status of women and children under 2 y, home gardening and poultry rearing practices and nutrition knowledge.

Methods: A two-stage cross-sectional sample household survey was conducted to represent the 12-village 2-district EHFP intervention population situated in the Lake Zone of Tanzania (n=300 households).

Results: Very few households practice vegetable home gardening (17.0%), although roughly two-thirds (59.5%) own land and cultivate crops (predominantly cassava and maize). Over 1/3 of households grow fruit (papayas, oranges, mango, and banana) yet 30% of these households did not consume fruit in the previous month. Poultry rearing is common (72.0%) yet only 42% of households consumed chicken in the last week. Only 12% of children between 6 and 24 months of age received a minimum acceptable diet. Over 10% of women 20-29 had a BMI below 18.5. Children under 2 are experiencing high rates of childhood stunting (33.6%) and underweight (16.0%). Monthly growth monitoring attendance is high (80%) yet 87% of caretakers indicated that the child's health and nutrition were not discussed when the child was last weighed. Only 12.8% of households indicated they utilize the services of government extension agents.

Conclusions: Tanzania Lake Zone districts can benefit from nutrition-focused agricultural interventions like EHFP. Heavy dependence on semi-subsistence agriculture yet low uptake government extension services, and high rates of malnutrition despite regular clinic attendance, are both missed opportunities. District services should capitalize on local food diversity and encourage improved dietary diversity.

Key Words: Sgriculture, home gardening, extension services, nutrition education.

PO3239

NEW DATA ON THE PRESENCE OF ORGANOCHLORINE PESTICIDE RESIDUES IN BREAST MILK FROM MOTHERS IN A CENTRAL AREA OF TRANSYLVANIA

D. Miere[1], L. Filip[1], R. Banc[1], A. Cozma[1], G. Zaharie[1], Z. Moldovan[2]

[1]University of Medicine and Pharmacy 'Iuliu Hatieganu' Cluj-Napoca, Cluj-Napoca, Romania
[2]National Institute of Research and Development for Isotopic and Molecular Technology Cluj-Napoca, Cluj-Napoca, Romania

Background and Objectives: Organochlorine pesticides, characterized by high chemical stability, emphasized persistency in the environment, liposolubility, is a category of pollutants that pose great public health concerns. They accumulates over time in fatty tissues, exerts toxic action on the body especially in periods of massive mobilization. Such mobilization takes place in case of increased energy demand, such as in period of lactation and are excreted in breast milk. Thus, in addition to maternal exposure to their toxic action, a major problem is the exposure of the infant to the breast milk, especially in the first months of life, when the milk is the only source of nourishment for many infants. Moreover the European Union documents (CEC, 2001, a.) include chlorine pesticides on the list of substances which are suspected to interfering with hormones. These considerations support the need for continuous determination of organochlorine pesticide residue levels in breast milk in areas exposed to these contaminants.

Methods: An area of interest in Romania for understanding the levels of organochlorine pesticide residues in breast milk is the town Turda and the surrounding area where, for various reasons, production, storage of waste, extensive use, there was a significant environmental pollution. Determination of pesticides was performed by coupled system gas chromatograph-mass spectrometer (GC/MS) in full scan mode at electron energy of 70 eV.

Results: The present paper presents concentration of chlorine pesticides determined from maternal milk collected from 20 subjects. The detected compound are (p,p)-DDE, (o,p)-DDE and DDT. The results are discussed in relation to age of mother and live site at regional level.

Conclusions: The results obtained show the presence of organochlorine pesticide residues in alarming quantities in breast milk and hence in the diet of infants fed with mother's milk.

Key words: Organochlorine pesticides, mother's milk, gas chromatography.

PO3241

MICROBIAL QUALITY OF FROZEN CHICKEN MEAT AT GROCERY STORES IN QENA GOVERNORATE

J. Daoud[1], R. F, M M. Maky[1]

[1]South Valley University , Qena, Egypt

Background and Objectives: Chicken meat is the most popular food worldwide and the Egyptian's favorite meat at the moment due to their good nutritive values, high quality protein, and low fat content and economic values.

Methods: 50 frozen chicken, 25 locally produced and 25 imported samples were taken for detection of total aerobic, total coliform, total faecal coliform and total Escherichia coli counts.

Results: The mean values of total aerobic, total coliform, total faecal coliform and total Escherichia coli counts for locally produced chicken were 2.1x103, 5.1x10, 4.9x10 and 3.5 cfu/g for breast and 2.7x103, 6.4x10, 6.4x10 and 1.5x10 cfu/g for thigh samples respectively. Meanwhile, the mean values for total aerobic, total coliform, total faecal coliform and total Escherichia coli counts for imported chicken meat were 5.4x102, 4.0, 0 and 0 cfu/g for breast and 2.4x103, 5.2, 3.2 and 3.2 cfu/g for thigh samples respectively. It could not detected faecal coliform and Escherichia coli from breast samples of imported chicken. All samples were acceptable from microbiological slandered limits.

Conclusions: The microbial qualities of locally produced chicken carcasses were higher than imported one in microbiological counts. The economic importances as well as public health significance of isolated microorganisms were discussed.

Key words: Microbial Quality, Frozen Chicken Meat, Grocery Stores.

PO3242

ANALYSIS OF NUTRIENT COMPOSITION OF TIGER NUT MILK

I. Hamzat[1], M. Olumakaiye[1]

[1]Obafemi Awolowo University , Osun, Nigeria

Background and Objectives: In some developing countries, access to cow's milk is not readily available to average inhabitants; therefore there is scarce milk supply in various countries and the ever increasing gap between the requirement and population. In view of this scarcity, efforts have been made over the years to develop alternative milk-like products from vegetable sources, termed Vegetable Milk. The objectives of this research were to: 1) To extract milk from Tiger nuts which are common plant foods in Nigeria, locally called aya, imumu, ofio; 2) To analyse the nutrient composition of Tiger nut milk;

3) To compare the nutrient composition of tiger nut milk with that of other milk types.

Methods: To achieve these, four tests of quality was carried out: sensory evaluation, proximate analysis, micronutrient determination and microbiological quality. Data collected during these tests were summarized using percentages, means and standard deviation in which hypotheses were tested using mean comparison.

Results: Proximate analysis showed that Tiger nut milk contains 87.30% moisture, 11.38 % carbohydrate, 0.63% fat, 0.42% protein and 0.27% ash. Micronutrient analysis showed that Tiger nut milk contained 3375mg calcium, 3375mg magnesium and 180mg Iron, Comparism analysis showed that Tiger nut milk was notably higher in carbohydrate, calcium, magnesium and Iron. Sensory evaluation analysis showed that in overall acceptability, soya milk received more preference than Tiger nut milk which was fairly acceptable as shown by the mean scores 4.00+0.71 and 3.24+1.20, respectively.

Conclusion: As a result of these findings, it is been concluded that Tiger nut milk is a good source of milk in areas where accessibility and affordability for Cow milk is inadequate, also for people with lactose intolerance or galactosemia and vegetarians.

Key words: Tiger Nuts, Milk, Sensory Evaluation, Nutrient Composition, Micronutrient determination.

PO3243

GENETIC VARIATIONS IN FE AND ZN CONTENTS OF GRAIN IN IRANIAN WHEAT LAANDRACES

B. Heidari[1], S. Padash[1], N. Daneshnia[2]

[1]Department of Crop Production and Plant Breeding, College of Agriculture, Shiraz University, Shiraz, Iran

[2]Department of Crop Production and Plant Breeding, College of Agriculture, Shiraz University, Shiraz, Iran

[3]Department of Plant Protection, College of Agriculture, Shiraz University, Shiraz, Iran

Background and Objetives: Malnutrition of micro-nutrients such as iron (Fe) and zinc (Zn) are becoming a major problem in populations living in less developed and developing countries. Wheat as one of the major food crops has received considerable attentions for increasing micronutrients. The aim of this study was to evaluate genetic variation of 50 Iranian wheat landraces.

Methods: Landraces were grown for evaluation of Fe and Zn contents in the seeds in 2012 in field experiment station of Shiraz University, Iran. Fe and Zn contents were measured by atomic absorption model Shimatzu-AA-670.

Results: Data indicated that Fe content varied from 24.9 to 66.5 mg kg-1 and the landraces KC120, KC4559, KC4793 and KC4858 with 66.5, 66.3, 64.1 and 64.0 mg kg-1 of seed dry weight had the highest Fe contents while the values in commercial cultivars were from 52.6 to 54.8. The landraces KC4684, KC4542, KC4682 had respectively 38.6, 37.6 and 37.3 mg Zn kg-1. Heritability estimates indicated that Fe (97.7%) and Zn (96%) were highly heritable. Genotypic coefficient of variation (GCV) showed that there are great variations for Fe (22.2%) and Zn (19.9%) among wheat landraces. Grain yield was not significantly correlated with Fe (r= 0.04) and Zn (r=0.10) showing that selection for higher yield reduces micronutrient in the seeds of wheat genotypes. Our results indicated that there are great variations for micro-nutrition's of wheat landraces and Fe and Zn are highly heritable and that focusing on higher grain yield may reduce micro-nutrients.

ConcIusion: Selection for higher Fe and Zn contents would results in commercial varieties that can be used for reducing malnutrition of human populations in developing countries.

Key words: Fe, Zn, Wheat, Genetic variation.

PO3244

GENETIC VARIATION AND INTERRELATIONSHIP OF SEED MUCILAGE, SWELLING FACTOR AND AGRONOMIC PROPERTIES IN PLANTAGO OVATA

B. Heidari[1], D. Karimi[1], N. Daneshnia[2], A. Dadkhodaei[1]

[1]Department of Crop Production and Plant Breedin, College of Agriculture, Shiraz University, Shiraz, Iran

[2] Department of Plant Protection, College of Agriculture, Shiraz University, Shiraz, Iran

Background and Objetive: mucilage is edible and used in medicine for its demulcent properties. It is a polar glycoprotein and an exopolysaccharide. Mucilage can be used in gastrointestinal inflammatory processes associated with topical irritation agents. The aim of this study was to evaluate mucilage content, swelling factor, morphological traits and antioxidants in seven wild P. ovata accessions that collected from different climates of south of Iran.

Results: Data indicated that although the mean of square for mucilage content was not significant, it ranged from 0.10 g in the accessions of Darab to 0.15 g in Abadeh and Firuzabad. Seed swelling factor averaged 11 ml, was in the range of 8.2 to 16.7 ml. Grain yield, averaged 4.9 g, ranged from 3 to 7.8 g in Jahrom and Marvdasht, respectively. The highest plant height was observed in Marvdasht (35.3 cm), Fasa (35.0 cm) and Abadeh (34.5 cm) while Darab (29.2 cm) was the shortest. The highest genetic coefficients of variation were observed for spike number (50.7%), catalase (47%), spike length (43%) and leaf area (43%). Among mucilage parameters, seed swelling factor

(24%) was highly variable. Correlation analysis indicated that seed swelling factor (r=-0.35) was negatively correlated with grain yield although mucilage content (r= 0.36) had positive correlation with grain yield. The wild accessions classified into three major groups based on their similarities in cluster analysis. Seed swelling, grain yield, antioxidants and morphological traits were highly heritable with heritability estimates over 70%.

Conclusion: the wild P. ovata genotypes are highly variable for grain yield and seed swelling factor that provide opportunities for producing high yielding mucilage varieties.

Key words: Genetic variation, Grain yield, Mucilage, Plantago, Swelling factor.

PO3245

BIODIVERSITY AND INTERRELATIONSHIP OF MICRONUTRIENTS AND BAKING QUALITY IN WHEAT LANDRACES

N. Daneshnia[1], S. Padash[2], B. Heidari[2]

[1]Department of Plant Protection, Shiraz University, Shiraz, Iran

[2]Department of Crop Production and Plant Breeding, Shiraz University, Shiraz, Iran

Background and Objetive: Bread wheat is known for its baking quality but breeding for higher grain yield decrease baking quality and micronutrients. We aimed to evaluate the micronutrient and baking quality in wheat landraces.

Methods: 50 wheat landraces and 10 commercial cultivars were cultivated for evaluation of Fe and Zn, baking quality and yield. The experiment was conducted in Shiraz University, Iran, in 2012. Fe and Zn contents were measured via atomic absorption.

Results: Data indicated that the range for micronutrient of Fe in wheat cultivars (52.6-55.9 mg kg-1 seed dry weight) was lower than in landraces (64.0-66.8). Similar results indicated that wheat landraces had higher variations for Zn (18.6-38.6 mg kg-1) than cultivars (13.0-29.0 mg kg-1). Gluten content varied from 11.1 to 19.6 % was lower in the landraces compared to commercial cultivars. The highest (16.3-18 ml) Zeleny sedimentation volume (ZSV) in landraces belonged to KC4830, KC4697 and KC4687. Grain yield per plant varied from 6.0 in Falat to 11.8 g in the landrace KC4632. The highest genetic gain from selection belonged to Fe (44.7%), ZSV (37.5%) and Zn (37.4%). Fe and Zn contents were positively correlated (r=0.31) showing that selection for increasing Fe increases Zn content in wheat genotypes and vice versa. Grain yield had weak correlations with Fe (r= 0.04) and Zn (r=0.09) contents and had negative correlation with ZSV (r=-0.45) showing that attempts for increasing yield decrease baking quality and does not affect micronutrients accumulation.

Conclusions: Results indicated that wheat landraces had greater variations and higher micronutrients than commercial genotypes and breeding for higher grain yield may decrease baking quality and micronutrients content. Wheat landraces provide opportunity for incorporation of higher micronutrients into the commercial cultivars.

Key words: Gluten, Landraces, Micronutrients, Variation, Wheat.

PO3246

GENETIC DIVERSITY IN MUCILAGE CONTENT OF PLANTAGO MAJOR

N. Daneshnia[1], B. Heidari, D. Karimi

[1]Department of Plant Protection, College of Agriculture, Shiraz University, Iran

[2]Department of Crop Production and Plant Breeding, College of Agriculture, Shiraz University, Iran

Background and Objetive: Plantago major, a species of Plantago is native to most of Europe and northern and central Asia, but has widely naturalised elsewhere. The leaves are edible as a salad green when young and tender and contain calcium and other minerals, with 100 grams of plantain containing approximately the same amount of vitamin A as a large carrot. We aimed to evaluate the mucilage content, swelling factor and morphological traits of Plantago plants.

Methods: Eighteen wild P. major accessions were collected from different climates of south of Iran at Shiraz University, in 2011.

Results: Data indicated that the ranges for mucilage content and swelling factor were 0.02-0.06 g and 7.9-12.6 ml respectively. The wild accessions of Mashhad (0.06 g per dry seed weight), Kashmar (0.06 g) had the highest mucilage content. Mashhad and Kashmar with 172.8 g and 152.5 g showed the highest grain yield per plant. Mucilage content and grain yield had positive correlation (r= 0.30). There was great variation for seed swelling factor and the highest swelling factor belonged to Ferdows (12.6 ml) and Kashmar (12.1 ml). The lowest mucilage content (0.02 g) and swelling factor (7.9 ml) belonged to Shiraz and Golpaygan accessions respectively. Genetic coefficient of variation (CVg) was relatively high for mucilage content (CVg=20.3%), mucilage swelling factor (CVg=33.5%) and grain yield (CVg= 38.7%). Stepwise regression analysis indicated that mucilage swelling factor (R2= 0.28) and grain weight (R2= 0.17) were highly contributed in grain yield variation of Plantago plants.

Conclusion: the results indicated that there were great variations for mucilage and swelling factor and grain yield of Plantago genotypes that can be used in breeding high yielding varieties.

Key words: Genetic variation, Mucilage, Plantago.

PO3247

EFFICACY OF MALIC ACID AND MODIFIED ATMOSPHERE PACKAGING AGAINST CAMPYLOBACTER JEJUNI IN POULTRY

E. Gonzalez-Fandos[1], N. Maya[1]

[1]University of La Rioja, Logroño, Spain

Background and Objectives: Raw poultry is a well-recognized source of Campylobacter jejuni and many surveys have confirmed the presence of this pathogen on fresh poultry. There is a great interest in reducing surface microbial contamination of poultry, with particular regard to reducing the levels of pathogens. The aim of this study was to evaluate the combined effect of malic acid washing and packaging in modified atmospheres on the growth of Campylobacter jejuni on poultry legs stored at 4ºC.

Methods: Fresh chicken legs were inoculated with Campylobacter jejuni. After the inoculation, the chicken legs were dipped into a 2% malic acid solution or distilled water (control). Inoculated samples were packaged under different gas mixtures: vacuum, 20%CO2/80%N2, 40%CO2/60%N2 or air Surface pH values, sensorial characteristics and Campylobacter jejuni, mesophiles and psychrotrophs counts were evaluated after treatment (day 0) and after 1, 3, 6, 8, 10, 13, 15 and 17 days of storage at 4º C.

Results: Significant differences ($p<0.05$) in mesophiles and psychotrophs counts were found between the legs treated with 2% malic acid and the control legs after treatment. The lowest mesophiles counts were observed in those samples packaged in 40%CO2/60%N2. Legs washed with a 2% malic acid solution showed a significant ($p<0.05$) inhibitory effect on Campylobacter jejuni compared to control legs, being about 1.38 log units lower in the first ones than in control legs after treatment. No significant reduction on Campylobacter jejuni was observed in samples packaged in modified atmospheres.

Conclusions: Immersion of chicken legs in a 2% malic acid solution can reduce Campylobacter jejuni populations on fresh poultry. Atmospheres containing 20%CO2 or 40%CO2 are not able to reduce Campylobacter jejuni.

Key words: Food safety, poultry, modified atmosphere packaging.

Acknowledgements: The authors thank the Regional Government and University of La Rioja (Spain) for its financial support (FOMENTA 2007/11 and API 11/09).

PO3248

EFFICACY OF TRISODIUM PHOSPHATE AGAINST SALMONELLA ATTACHED TO POULTRY SKIN DURING REFRIGERATED STORAGE

E. Gonzalez-Fandos[1], C. Ferreira[1]

[1]University of La Rioja, Logroño, Spain

Background and Objectives: Raw poultry is a well-recognized source of Salmnella spp. and many surveys have confirmed the presence of this pathogen on poultry. The presence of Salmonella in poultry receives major attention because of the importance of this bacteria as causative agent of human foodborne illness. There is a great interest in reducing surface microbial contamination of poultry, with particular regard to reducing the levels of pathogens. The aim of this study was to evaluate the effect of trisodium phosphate washing on the growth of Salmonella on poultry legs stored at 4ºC for 8 days.

Methods: Fresh chicken legs were inoculated with Salmonella. After the inoculation, the chicken legs were dipped into either a 8, 10 or 12% trisodium phosphate solution or distilled water (control). Surface pH values, sensorial characteristics and Salmonella and mesophiles counts were evaluated after treatment (day 0) and after 1, 3, 6 and 8 days of storage at 4º C.

Results: Significant differences ($p<0.05$) in mesophiles counts were found between the legs treated with trisodium phophate and the control legs. Legs washed with a 12% trisodium phosphate solution showed a significant ($p<0.05$) inhibitory effect on Salmonella compared to control legs, being above 1.0 log unit lower in the first ones than in control legs after treatment. After treatment, Salmonella counts were 2,65 log cycles lower in legs treated with 12% trisodium phosphate than in control ones.

Conclusions: Immersion of chicken legs in a trisodium phosphate solution can reduce Salmonella populations on fresh poultry.

Key words: Food safety, poultry, pathogens.

PO3249

NUTRITIONAL AND SENSORY STABILITY OF STORED HOME MADE ROSELLE JUICE

O. Ashaye[1]

[1]Obafemi Awolowo University, Institute of Agricultural Research and Training , Osun, Nigeria

Background and Objetive: Roselle juice is known to be rich in nutrients and is one of the most widely consumed drinks in Africa, Asia and South America. At present there is little information on the storage stability of the drink. The carotenoid, antioxidant, antinutritional and sensory stability of stored home made roselle juice was investigated.

Methods: Control (Commercial roselle juice), and freshly prepared 10% 20%, 30%, 40% and 50% roselle juice were stored under cold temperature (8±2oC) for a period of two weeks. The juice where evaluated at 0 day, 1 week and 2 weeks for chemical properties such as (Carotenoid, vitamin C, titratable acidity, pH, specific gravity, total solids and ash) antinutritional factors (saponin, tannin, phytate and oxalate). Sensory evaluation was done by a 10 member panel made of male and female adults.

Results: Fifty percent (50%) roselle juice at 0 day was significantly higher than other roselle juice in titratable acidity (0.097%), specific gravity (0.962%), ash (0.062%), Vitamin C, (8.700mg/100g), carotenoid (461.05µg/100g), tannin (0.037%) and oxalate (1.705%). In sensory attributes, there was increased preference for roselle juice from 10%-30%. There was a concomitant decrease in some chemical properties and antinutritional factors with increase in storage time. The concomitant decrease in carotenoid at zero day ranged between (424.250µg/100g -461.050µg/100g) compared with (386.350µg/100g -439.400µg/100g) at two weeks and in vitamin C, it ranged between (7.820-8.700mg/100g) at zero day to (6.425-8.415mg/100g) at two weeks. In sensory attributes, there was still an increased preference for roselle juice from 10%-30% at two weeks of storage. Fifty percent roselle juice received lower scores at two weeks of storage.

Conclusion: Generally, roselle juice between 10%-30% was acceptable in sensory scores at two weeks and there was no adverse change in the nutritional quality of the juices.

Key words: Roselle, antinutritional, carotenoid, sensory, vitamin C.

PO3250

STUDY ON HISTAMINE CONTENT IN ROHU FISH (LABEO ROHITA) SOLD IN NEPALESE MARKETS

K P. Rai[1]*, H. Pradhan*[1]*, B K. Sharma*[1]*, B P. Shrestha*[1]

[1]Department of Food Technology and Quality Control, Central Food Laboratory, Kolkata, Nepal

Background and Objetive: Histamine is a biogenic amine that occurs in many food products particularly in histidine rich fishes, which is converted enzymatically by some spoilage bacteria into histamine. Different analytical methods such as TLC, ELISA, Colorimetric, HPLC, GC-MS, Fluorometery have been developed for the estimation of such amines in different food products. However, a simple and easy colorimetric method was applied for determination of histamine content in fish samples which showed the R2= 0.998, LOQ and LOD value for histamine in frozen fish samples were determined as 0.02mg/100g and 0.006mg/100g respectively. This study was designed to study the histamine content in Rohu (Labeo rohita) fish, which is a very popular variety of fresh fish sold in Nepalese markets mainly imported from India and some are also produced within the country.

Methods: Altogether 53 fish samples were collected from different main markets of Nepal.

Results: Only the 7.54% of fish samples collected from Biratnagar and Birgunj were found to be exceeded in histamine content showing the range of ND to 8.05mg/100g. Beside these samples, all were found within the limit of recommended concentration i.e. 5mg/100g of US FDA.

Conclusion: It can be concluded that most of Rohu fish sold in Nepalese markets were found within safe level for histamine and there would be less chance of histamine poisoning due to consumption of such fish in Nepal. However, the cold chain should be maintained during whole chain of transportation to selling points to prevent the growth of spoilage bacteria that might cause production of histamine in such fish.

Key words: Histamine, Rohu (Labeo rohita), Colorimetric method, Nepal.

PO3251

OXIDATIVE STABILIZATION OF COOKING OIL BLEND WITH LEAF EXTRACT OF EUCALYPTUS CITRIODORA

S A S. Chatha[1], S. Ali[1], Q. Ali[2], A I. Hussain[1], M U. Arshad[3]

[1]Institute of Chemistry, Government Collage University, Faisalabad, Pakistan
[2]Department of Botany, Government Collage University, Faisalabad, Pakistan
[3]Department of Food Science, Government Collage University, Faisalabad, Pakistan

Background and Objetive: Lipid peroxidation not only limits the shelf-life of vegetable oil but also has serious health and economic concerns. Synthetic antioxidants commonly used to improve the shelf life and the oxidative stability of lipids is being discouraged by the consumers due to their perceived carcinogenicity. The scientists are investigating different plants material as an alternate source of safe, nutritious and natural antioxidant to be added in lipid food to cope the recent challenges. The present study was conducted to assess the effects of Eucalyptus citriodora leaf extract on the oxidative stability of blended vegetable oil (Canola, Rap seed and Sunflower oils; 45:20:35 v/v, respectively).

Methods: The blended oil was stabilized (@300 mg/L) with ethanolic extract of Eucalyptus citriodora leaves and heated at 65°C for 8 hours daily for the period of 100 days. The oxidative stability of stabilized and control sample (un-stablized) vegetable oil was measured following the parameters such as free fatty acid (FFA) contents, peroxide value (PV), sponification value (SV), iodine value (IV), color, cloud point and refractive index (RI) after every 10 days, periodically.

Results: Data showed that E. citriodora leaf extract was very effective to maintain the oxidative stability of blended vegetable oil for long duration as compared to control oil samples.

Conclusion: it can be concluded that E. citriodora leaf extract is a potent source of natural antioxidants and can be used to improve the shelf life of vegetable oils.

PO3252

COMPARATIVE EFFECT OF DIFFERENT SMOKING PROCESS ON BIOCHEMICAL, MICROBIAL AND SENSORY CHARACTERISTICS OF PACIFIC OYSTER CRASSOSTREA GIGAS

S. Selmi[1], N. Bouriga[2], N. Toujani[1]

[1]Institut National de Nutrition et de Technologie Alimentaire, Tunisia
[2]Institut Supérieur de Pèche et d'Aquaculture de Bizerte, Tunisia

Background and objectives: As fresh seafood, oyster was characterized by high initial load of microflora and short shelf-life, which causes substantial practical problems for its distribution. This paper deals with the effects of different smoking procedures and chilled storage period on pacific oysters, as assessed by microbiological and chemical parameters. Hedonic tests were also performed to assess consumers' perceptions and preferences towards different smoking temperatures.

Methods: Pacific oysters of commercial size measuring were kept in ice and transported to the laboratories where they were rapidly scrubbed, rinsed and the meat was aseptically extracted. The freshly extracted meats were separated in to two lots: (i) the first one was used for raw material, (ii) the second lot was processed according to the three smoking methods (S1: smoking at 45°C; S2: smoking at 85°C; S3: smoking at 125°C).

Results: N-3 and n-6 polyunsaturated fatty acids levels were 0.81 and 0.11 g/100g fresh oyster respectively. After processing, all fatty acid groups increased ($p<0.05$) with higher levels in oyster smoked at 125°C. However, storage period didn't have any effect on fatty acid contents. So, saturated, monounsaturated and polyunsaturated fatty acids (4.22; 2.08 and 3.80 g 100 g oyster) contents remain unchanged after 28 days of chill storage. Based on sensory and microbial data, the three smoking methods applied, resulted in a clear preservative effect on oyster samples. Independently of storage time, hot smoked samples (85°C and 120°C) were perceived to be significantly ($p<0.05$) more acceptable than other samples. Smoking process significantly lessened the levels of different strains and pseudomonas was completely eradicated ($p<0.05$).

Conclusions: Assessment of the oyster's quality at different brining-smoking methods lessened the growth of bacteria and led to an appreciated product with higher n-3 and n-6 polyunsaturated fatty acids content.

Key words: Oyster, Smoking, Quality, Fatty acids.

PO3253

FOOD AUTHENTICITY FOR FOOD SAFETY

A. Obiedzinska[1]

[1]General Economics Department, Institute of Agricultural and Food Economics, National Research Institute, Warsaw, Poland

Background and Objectives: Food safety and food authenticity are related topics that concern all over the world. It is very important to make sure that the food we purchase are of high quality and safe for consumers. Counterfeiting of food has and can have a number of consequences (e.g. economical or consumers health and wellbeing). Adulteration of food and unfair trade practices, in general food authenticity and traceability practices are monitored in Poland by national official food control agencies.

Methods: Food quality, safety and authenticity reports were obtained from Poland national official food control agencies.

Results: Comparing data of quality control of agricultural and food products over the years in Poland there is a clear tendency of improving of food quality, organoleptic properties of food available on the polish market. The physical and chemical properties of food are slightly deteriorated but still are at low level (less than 3% of controlled food). Majority of food fraud cases are mainly dealing with mislabeling, false declaration of content and/or health claims. Most problems were related to cereals and cereal products, meat and meat products, fish and fish products. Comparing latest data on food authenticity there is a decreasing trend of adulteration of meat, butter and olive oil due to growing awareness of growing availability of efficient analytical capabilities to control safety, and quality and protect authenticity of food from "farm to fork".

Conclusions: There is a need for straightening framework approach to food law, based on integrated approach to food safety and quality from "farm to fork" with clearly defined duties and responsibilities of food operators. There is also need for elaboration fast and efficient analytical methods to be used for food authenticity, traceability and prevent fraudulent practices and build confidence to food chains.

Key words: Food safety, authenticity, adulteration.

PO3254

COMPARISON OF THE SENSORY CHARACTERISTICS OF COMMERCIAL RED PEPPER POWDER PRODUCED IN ASIAN COUNTRIES

J H. Yang[1]*, M A. Lee*[1]*, J E. Cho*[1]*, Y B. Chung*[1]*, H Y. Seo*[1]

[1]World Institute of Kimchi, Gwangju, Republic of Korea

Background and Objective: The chemical and sensory properties of the red pepper powder produced in the Asian countries (India, Vietnam, China, and Korea) were evaluated.

Methods: To investigate the effects of the red pepper powder on Kimchi taste,capsaicinoids, organic acids, and free sugars and sensory properties were studied to compare the quality of the red pepper powders. Result and

Conclusions: Total capsaicinoid, organic acids and free sugar contents of red pepper powder were 21.01 to 88.30mg/kg, 111.75 to 170.82mg% and 5.50 to 19.95mg%, respectively. The highest content of capsaicinoids was the produced in Vietnameseas 88.30mg/kg, whereas Chinese was the lowest, showing 21.01mg/kg. Organic acids such as citric acid were significantly higher of commercial red pepper powder produced in Asiancountries. The highest content of citric acid was produced in India as 106.63±2.62mg% and Vietnamese was the lowest as 55.33±7.54mg%.The sensory evaluation data showed that the red pepper powders produced in India had the highest value of sourness and total overall strength of 2.45 and 6.73, respectively. The red pepper powders produced in Vietnam had the lowest value of sourness and sweet taste of 1.95 and 1.48. As a result of the sensory evaluation, overall acceptability of the red pepper powders was highly influenced by the contents of fructose (3.18 to 11.24 mg%), glucose (2.32 to 8.71 mg%) and citric acid (55.33 to 106.63 mg%). Vietnamese red pepper powder showed higher amount of capsaicin content and obtain higher sensory evaluation in hot taste.

Key words: Sensory characteristics, Red pepper powder, Capsaicinoids, Asian countries, Kimchi.

PO3255

ECO NUTRITION. RETHINKING ASSESSMENT OF NUTRITION AND CLIMATE IMPACT IN PUBLIC PROCUREMENT STRATEGIES – CASE-INSIGHTS FROM INTERVIEWS WITH FOODSERVICE PROFESSIONALS

B E. Mikkelsen[1]

[1] AAU.MENU, Aalborg University, Copenhagen, Denmark

Background and objectives: Food intake has not only a significant impact on individual and population health. The environmental impact of food production and consumption is among the most important causes of climate change and contributes to a substantial part of greenhouse gas (GHG) emission. Especially the impact of public food seems to be in focus since there is an increasing expectation to take both climate and nutrition into consideration when planning public food and since public foods in many cases are expected to play an active role in public climate mitigation strategies. The objective of the study was to explore the views of public food planners on the issue of eco-nutrition and to determine the need for future menu planning tools that might be able to fulfil the needs for integrated nutritional and climate impact assessment in public foodservice.

Methods: In depth interviews were carried out with administrative dieticians in 5 public food service units at hospitals and large institutions in Denmark. An open ended protocol were used and interviews were transcribed and a thematic text analysis carried out.

Results: Results showed that dieticians increasingly are faced with demands on being able to declare the climate impact of public food menus in addition to the nutritional impact and that the food and nutritional planning of diets are increasingly computer and database driven.

Conclusion: There is a need for integrating traditional information on nutrient content with climate impact information in foods used for menu planning and dietary assessment in public food service. Official food composition databases should integrate climate impacts and models for the integration of such data should be agreed on by involving both climate and nutrition expertise.

Key words: Econutrition, public food service, climate impact, food composition.

PO3256

RELATIONSHIP BETWEEN CHEMICAL PROPERTIES AND SENSORY EVALUATION IN COMMERCIAL KIMCHI

M A. Lee[1]*, H Y. Seo*[1]*, J E. Cho*[1]*, J H. Yang*[1]*, Y B. Chung*[1]

[1]World Institute of Kimchi , Seo-gu, Kwangju-si, Republic of Korea

Background and Objetive: The aim of the present investigation is to study interactions between chemical properties and sensory characteristics of Kimchi.

Methods: The chemical properties and sensory characteristics of market-available Kimchi from 44 companies were evaluated in comparison. Firstly, freshly made Kimchi were purchased from the market and the chemical properties of Kimchi were determined by measuring pH, titratable acidity, salinity, and capsaicinoid contents. The sensory characteristics included 10 items with a 5 score scale: color, hot taste, salty taste, sour taste, sweetness, off-flavor, anchovy flavor, garlic flavor, texture, and overall preference. The sensory descriptors were determined by a panel composed of 50 people aged 20~50 years. The second step consisted in studying interactions between chemical properties and sensory evaluation. The chemical properties of commercial fresh Kimchi are significantly different that it showed pH of 3.99 ~5.84, titratable acidity of 0.56~1.12%, salinity of 1.17~2.87%, and capsaicinoid contents of 0.44~3.15mg%. Sensory assessment of sour taste was positively related to the titatable acidity and pH was negatively related. The salinity was also positively related to salty taste. In particular, capsaicinoid contents showed a close relationship with hot taste for Kimchi (R2=0.508). Also, it was analyzed correlation coefficient (R2) of independent variable (overall preference) between sensory attribute in commercial Kimchi. The result of regression analysis, R2 in the color, off flavor, hot taste showed, 0.664, -0.576, 0.708, respectively.

Conclusion: It was found that saltinity, color, and hot taste had the greatest effect on the overall preference in commercial Kimchi.

Key words: Kimchi, sensory characteristics, preference, chemical properties.

PO3257

OXIDATION AND HYDROLYTIC PROFILES OF CORNICABRA VIRGIN OLIVE OILS OBTAINED FROM OLIVE FRUITS HARVESTED AT THREE DIFFERENT MATURATION DEGREES

R. Olivero-David[1], C. Mena[1], M A. Pérez-Jimenez[1], G. Vergara[1], B E. Sastre[1], C. de Lorenzo[1], F J. Sánchez-Muniz[2]

[1]Instituto Madrileño de Investigación Agraria y Desarrollo Rural Agrario y Alimentario. Madrid, Spain
[2]Departamento de Nutrición. Facultad de Farmacia, Universidad Complutense de Madrid, Madrid, Spain

Background and Objetive: Virgin olive oil is the most representative oil produced and consumed in the Mediterranean basin. This oil has nutritional, cultural and gastronomic importance due among several reasons to its fatty acid composition and minor compounds profiles. However, the concentration of antioxidants as polyphenols and tocoferols could be highly dependent on the harvesting and maturation degree of olive fruits. We aim to compare the total, oxidative and hydrolytic alterations of three virgin olive oils obtained from olive fruits of Cornicabra variety of three different degree of maturation.

Methods: Harvesting of Cornicabra olive fruits was performed in three different periods (C1, C2 and C3) separated by periods of two-week using the ABENCOR system. The total alteration as polar content (PC) and the oxidative and hydrolytic alterations were tested by column chromatography followed by HPSEC analysis of the isolated polar fraction.

Results: The oil obtained from the first harvesting (C1-oil) showed the lowest PC (amounts in g/100 g oil) 1.93±0.07 followed by the C2-oil (2.15±0.16) and finally by the C3-oil (2.70±0.04) (all P<0.05). Oils did not significantly differ in triglyceride dimers but C1-oil shows less oxidized triglycerides (0.39±0.02) than C2-oil (0.61±0.10) and C3-oil (0.84±006) (all P<0.05). Oils did not differ in isolated diglycerides, monoglycerides and free fatty acids; however, C1-oil and C2-oil showed less hydrolytic alteration than C3-oil (P<0.05).

Conclusion: Data clearly suggest that oils obtained from the last harvesting show higher autooxidation and hydrolytic alterations due probably to its lower antioxidant compound content (e.g polyphenols). These facts have permitted us to establish the optimum period for fruit collection in order to keep their antioxidant and shell-life properties.

Key words: Cornicabra, olive fruit, olive oil, maturation, harvesting, oxidation, hydrolysis. Granted by project INIA RTA 2010-00097.

PO3258

THERMAL OXIDATION IN THREE DIFFERENT PICUAL EXTRA VIRGIN OLIVE OILS DURING POTATO FRYING

R. Olivero-David[1], C. Mena[1], M A. Pérez-Jiménez[1], G. Vergara[1], B E. Sastre[1], C. de Lorenzo[1], S. Bastida[2], F J. Sánchez-Muniz[1]

[1]Instituto Madrileño de Investigación Agraria y Desarrollo Rural Agrario y Alimentario. Madrid, Spain
[2]Departamento de Nutrición. Facultad de Farmacia, Universidad Complutense de Madrid, Madrid, Spain

Background and Objetive: Fried food consumption has gain popularity and gastronomic relevance. Due to economical and health aspects the knowledge of stability and shell-life of oil used in frying is of main importance. We aim to compare the thermal oxidation degree induced during potato frying in three extra virgin olive oils obtained from Picual olive fruits harvested at three different levels of maturation.

Methods: Olive fruits of Picual variety obtained in three successive harvesting (C1, C2, and C3) separated by two week periods were obtained. Olive oil was extracted using the ABENCOR system. Domestic fryers of 1.1 L vessel volume were used to fry sets of 183 g potato. Forty discontinuous fryings were performed. Fresh oil was added after each 5 fryings. Oil total alteration was evaluated as polar compounds (PC). The HPSEC analysis also permitted quantifying polymerized compounds (oligomers and dimers of triglycerides, PTG+DTG), oxidized triglycerides (OTG) and hydrolytic compounds.

Results: The PC, PTG+DTG, and OTG linearly increased during frying in the three oils (all P<0.01; r2 >0.949). After 40 fryings the three olive oils presented PC and thermal oxidation far from the cut-off points marked by present regulations. Oil obtained from mature olive fruits (C3-oil) increased PC 0.412±0.010 g/100 g oil each frying while PC increase in medium- and lower maturation-oils was 23% and 25.5% less, respectively. Similarly, the oil obtained from the more mature fruits displays the higher increase rate for PTG+DTG and OTG.

Conclusion: Results clearly suggest that Picual olive oils obtained from lower and medium maturation degrees performed better on potato frying.

Key words: Picual variety, extra virgin olive oil, frying, potato, thermal oxidation. Granted by project INIA RTA 2010-00097.

PO3259

SHORT-TERM DIGESTIBILITY OF KETOLINOLEIC ACIDS AND TOTAL OXIDIZED FATTY ACIDS IN FASTED AND NON-FASTED RATS

S. Bastida[1], R. Olivero[1], A. Paduano[2], V. Fogliano[2], M. Gonzalez-Muñoz[3], J. Benedí[1], R. Sacchi[2], F. Sánchez-Muniz[1]

[1]Universidad Complutense de Madrid, Madrid, Spain
[2]Università degli Studi di Napoli Federico II, Napoli, Italy
[3]Universidad de Alcalá, Madrid, Spain

Background and Objetive: Western diets contain substantial amounts of lipid oxidation products. Highly thermal oxidized oils are partially digested and absorbed but the absorption of individual groups of compounds is unknown. We aim to investigate the effects of oil oxidation and fasting status on short-term digestibility of oxidized fatty acids (ox-FA) and ketolinoleic acids (keto-LA) of used in frying sunflower oils were evaluated.

Methods: During three days 12 rats were overnight fasted while other 12 had free access to diet. From day 4, and for 4 days, two control groups of rats, nonfasted (NFC) and fasted (FC), received the same amount of fresh oil, and two groups of rats, nonfasted (NFT) and fasted (FT), received 1 g/100 g body weight of sunflower oil reused from 40 deep-frying processes. Intra-intestinal MDA together with Ox-FA and keto-LA were determined 5 hours after the last administration in the various gastro-intestinal compartments.

Results: MDA and keto-LA concentrations correlated each other ($P < 0.05$). Ox-FA and keto-LA levels found in the gastric lumen suggest that digestion contributes to these compounds formation. Oil digestibility was highest in NFC and lowest in FT rats. NFT and FT rats had higher (at least $P < 0.05$) intra-intestinal MDA, ox-FA and keto-LA than NFC and FC.

Conclusions: Oil alteration influenced the digestibility of total-ox-FA and keto-LA more than fasting. Total ox-FA and keto-LA were poorly absorbed during the first 5 h after the fresh oils administration but efficiently absorbed after the altered oil administration. The consumption of products containing oxidized fatty acids must be avoided overall after large periods of fasting.

Key words: Absorption, Frying oils, Ketolinoleic acids, MDA, Oxidized fatty acids. Granted by the Spanish project AGL-2008 04892-C03-02 and by Consolider-Ingenio 2010 project reference CSD2007-00016.

PO3260

NUTRITIONAL DVERSITY OF NATIONAL FOOD SYSTEMS LINKED TO CHILD NUTRITION

R. Remans[1], S. Wood[1], N. Saha[1], T L. Anderman[1], R. DeFries[1]

[1]The Earth Institute at Columbia University , Palisades, USA

Background and Objetive: Efforts to increase yields have largely excluded consideration of the diversity of food items and their nutrients (nutritional diversity), though this is recognized as a crucial component for human health. In this study, we explore two key empirical questions: (1) does nutritional diversity of national food supply help explain patterns of nutrition-related health outcomes? (2) do countries with more diverse food production systems have greater diversity in their food supply?

Methods: We integrated agriculture, economic and health data for 153 countries from FAOSTAT and the World Bank database for two time periods 2000-2009 and 1990-1999. Nutritional diversity was calculated using three complementary diversity metrics, integrating tools from nutrition and ecology science: Shannon, Modified Functional Attribute Diversity (MFAD), and the percent of energy derived from non-staple food items.

Results: We find strong associations between nutritional diversity of the food available for consumption in a country (food supply) and key child nutriition outcomes. Furthermore, we find that in low-income countries food supply diversity is dependent on national production diversity, while for middle- and high-income countries income and trade are better predictors.

Conclusions: Our results provide evidence that national-level food policies should integrate metrics of nutritional diversity in addition to the economic, caloric, and yield-based metrics commonly used to assess and guide agricultural systems.

Key words: Nutritional diversity, food systems, child nutrition.

PO3261

ASSESSMENT OF CAFETERIA MENUS WITH NUTRIENT PROFILING MODELS

D. Dikmen[1], G. Pekcan[1]

[1]Hacettepe University Faculty of Health Sciences Nutrition and Dietetics Department Ankara, Ankara, Turkey

Background and Objectives: Nutrient profiling is the science of categorization of foods according to their nutrient

composition. Serving a healthier cafeteria menu is essential for the health of the consumers. The objective of this study was to test the efficacy of nutrient profiling models in the assessment of cafeteria menus served in universities.

Methods: Monthly lunch menus of five university (3 private and 2 public university) cafeteria which are located in Ankara, Turkey were evaluated according to their macro and micro nutrient contents, in meeting the daily energy and nutrient needs of the university students. Also menus were evaluated by Nutrient Rich Food Index 9.3 (NRF 9.3), Food Standards Agency (FSA) FSA-Ofcom WXY and International Choices Programme (ICP) Nutrient Profiling Models.

Results: It was determined that, in cafeteria menus the average percentage of energy from carbohydrates, protein and dietary fat were 44.7%, 15.4% and 40%, respectively. According to NRF 9.3 model lowest score was 12.3 and the highest score was 16.5. Using FSA-Ofcom WXY model all the scores were below 4 and menus were considered as healthier. Mann Whitney U test was used to compare models in universities and no statistically significant difference was found ($p>0.05$). Mainly, fiber (49.1%) and saturated fatty acids (78.5%) criteria were not complied, in menus, when ICP Model was applied. In the study, similar results were determined with NRF 9.3 and ICP models.

Conclusions: It could be concluded that nutrient profiling models could be used objectively to evaluate the nutritional profiling of the cafeteria menus. According to the results of this study, ICP nutrient profiling model looks more appropriate to evaluate the cafeteria menus.

Key words: Cafeteria menus, nutrient profiling models, school health.

PO3262

CONSUMERS` WILLINGNESS TO EAT CHOLESTEROL-LOWERING FOODS: THE ROLE OF FAMILIARITY, BELIEFS AND ATTITUDES

E. Babicz-Zielinska[1], M. Jezewska-Zychowicz[2], A. Dabrowska[1]

[1]Department of Trade and Services, Gdynia Maritime University, Poland
[2]Department of Organization and Consumption Economics, Warsaw University of Life Sciences, Poland

Background and Objectives: Familiarity and cognitive determinants of consumers-willingness to eat functional foods of different kind play an important role in their acceptance and consumption. The understanding of these relations requires further research. The objective of this research is better understanding of consumers-behaviour by exploring the determinants of willingness to eat cholesterol-lowering foods (CLF).

Methods: A questionnaire survey was carried out in September 2008. A total of 1002 Polish consumers aged 15 years or more (X=43.8; SD=18.3) were recruited. Obtained data included socio-demographic characteristics, selected beliefs on CLF, attitudes towards these foods, familiarity with them, and willingness to eat them next year. Participants-opinions were scored on 5-points scales. Descriptive statistics, bivariate correlation matrices and linear regression analyses were used.

Results: About 1/3 of participants were not familiar with CLF. Among those who were familiar with these foods, more than a half of them (50.8%) did not eat CLF at all, and only 13.1% ate these foods daily. The effect of consumers-beliefs, attitudes, and familiarity with CLF on willingness to eat them was examined by using a hierarchical linear regression. The first step of regression, comprising opinions on health value, benefits, risk, and attitude was significant, $R2=0.190$, $F(4,768) = 389.191$, $p<0.001$. The overall model, including familiarity, predicted significantly consumers-willingness to eat CLF next year, $R2=0.209$, $F(5,767) = 415.767$, $p<0.001$. The significant predictors of willingness to eat them were opinions on benefits (Pearsons-correlation coefficient $r = 0.132$, $p<0.001$), attitude ($r = 0.279$, $p<0.001$), and familiarity ($r = 0.143$, $p<0.001$).

Conclusion: The consumers willingness to eat CLF was determined by their familiarity, beliefs on benefits and positive attitudes. The increasing consumption of these foods requires to provide an information about products and opportunity to try them.

Key words: Functional foods, consumer, familiarity, beliefs, attitudes.

PO3263

IMPACT OF NUTRITIONAL CLAIMS ON CONSUMERS' ACCEPTANCE OF CHEESE WITH MODIFIED SALT CONTENT

M. Jezewska-Zychowicz[1], J. Czarnacka-Szymani[1]

[1]Department of Organization and Consumption Economics, Warsaw University of Life Sciences, Poland

Background and objective: Change of the composition of the food product allows to counter the growing problem of diet-related diseases, also hypertension. The aim was to assess the impact of various forms of nutritional information on the package of cheese on the consumers'acceptance and the willingness to buycheese with standard and modified amount of sodium chloride.

Methods: The survey was completedin June2011 among 100 Polish consumers.Three types of cheese:with standard sodium chloridecontent (P), with 15% of reduction of NaCl (P-15), with 25% of reduction of NaClcompared toa standard one (P-25) were assessed. Survey participants rated three pairs of

cheeses with different nutritional labels. In each pair one cheese was presented with two different labels in terms of the scope of nutritional information.

Results: Nutritional labels did not change significantly the overall assessment of the product desirability. Nevertheless, cheese P presented with short table with nutritional value (STNV) was very high scored (rate 8 and 9 on 9-points scale) by 33%, with extended table (ETNV) by 38% of participants. Cheese P -15 with ETNV was very high scored by 30.0% and with ETNV and claim "Contains 15% less salt" by 41%. Cheese P -25 with ETNV was very high scored by 35.0% and with ETNV and claim "Reduced salt content" by 41%. More people expressed their willingness to purchase the cheese with the labels with extended nutritional information, and in particular with the claim of reduced sodium chloride content. The nutritional claims placed on the product reduced the importance of taste when the choice was made.

Conclusions: The extended nutritional information, and especially nutritional claims increased the consumers' acceptance and willingness to buy cheese with modified content of sodium chloride.

Key words: Nutritional claims, acceptance, consumer, reformulation.

PO3264

DETERMINANTS OF WILLINGNESS TO EAT YOGHURTS WITH PROBIOTICS AMONG POLISH CONSUMERS

A. Dabrowska[1], M. Jezewska-Zychowicz[2]

[1]Deparment of Trade and Services, Gdynia Maritime University, Gdynia, Poland

[2]Department of Organization and Consumption Economics, Warsaw University of Life Sciences, Warsaw, Poland

Background and Objectives: Most studies highlight the predominant role of consumers-perception for acceptance of innovative products. Objective is to identify factors determining the willingness to eat yoghurts with probiotics among Polish population.

Methods: A questionnaire survey was carried out in September 2011. A total of 1000 respondents participated in the survey. The obtained data included socio-demographic characteristics, acceptance of probiotics in yoghurt, familiarity and frequency of eating yoghurts with probiotics, perception of benefits and threats and willingness to eat them next year. The opinions were scored on the scales. Frequency analysis, cluster analysis and regression model were applied in data analysis.

Results: More than 2/3 of respondents (62.3%) approved probiotic cultures in yoghurts. The more positive consumers-opinions on healthy aspects of eating yoghurt included higher willingness to eat yoghurt with probiotics. About a half a population (48.6%) were familiar with probiotic yoghurts and ate them. 15% of respondents did not consume those foods although they were familiar with them. 36.4% of subjects unfamiliar with probiotic yoghurt declared willingness to try it. Ward-hierarchical clustering according to perceived healthy benefits, threats, and declared attitude towards product led to identification of three homogenous sub-groups: -neutral- (59.2%), -followers- (25.2%), and -opponents- (12.5%). Among the dependent items included to the regression model were socio-demographic characteristics, cognitive factors, familiarity and eating frequency. The independent variable i.e. the willingness to eat yoghurt with probiotics next year was determined to a greater degree by familiarity, eating frequency and perceived healthy benefits.

Conclusion: The increase of willingness to eat probiotic yoghurts requires the provision of information about products and opportunity to try them. Socio-demographic features do not significantly determine the consumers-decisions concerning yoghurt with probiotics.

Key words: Probiotics, consumer, acceptance. Acknowledgements: The study was financed by NCN - project # N312 253840.

PO3265

KINETIC CHARACTERIZATION OF SOLUBLE AND MEMBRANE-BOUND PEROXIDASES FROM RED CABBAGE (BRASSICA OLERACEA)

M I. Fortea Gorbe[1], J A. Pellicer Balsalobre[1], A. Serrano Martínez[1], C. Lucas Abellán[1], S. López Miranda[1], E. Núñez Delicado[1]

[1]Universidad Católica San Antonio Murcia, Murcia, Spain

Background and Objetives: The aim of this work was to extract and characterize soluble and membrane-bound peroxidases from red cabbage and to determine their kinetic parameters in order to maximise the quality and minimise the economic and nutritional loss induced by this oxidative enzyme during storage or processing.

Methods: Soluble and membrane-bound peroxidases (POD) were extracted from red cabbage (Brassica oleracea L. var. capitata f. rubra) using Triton X-114 and characterized by spectrophotometric methods, using 2,2´-azinobis(3-ethylbenzothiazolinesulphonic acid) (ABTS) as the H-donor.

Results: Optimum activity, was obtained at pH 4.0 in both soluble and membrane-bound enzymes, and both were inactivated by the anionic detergent sodium dodecil sulphate (SDS)

at all pH values studied. The KM and Vm values for H2O2 were found to be 0.98 mM and 8.1 μM/min M/min, respectively, for soluble POD; and 0.82 mM and 6.1 μM/min M/min, respectively, for membrane-bound POD. When the ABTS concentration was increased, maintaining the concentration of H2O2 steady, the activity was inhibited at the highest ABTS concentrations in soluble POD. Ascorbic acid was found to be the most active reducing agent for both enzymes. The effect of cyclodextrins was also studied, and the complexation constant Kc between hydroxy-propyl-β-cyclodextrins (HP-β-CDs) and ABTS was calculated using the enzymatic method (Kc= 312 M-1).

Conclusions: Both enzyme forms were inactivated by the anionic detergent SDS. The reducing agents ascorbic acid, L-cysteine and metabisulphite also inhibited these enzymatic forms. The use of substrate sequestrant agents such as CDs has an antibrowning effect due to the entrapment of phenolic compounds in the hydrophobic cavity of CDs. Food grade cyclodextrins could be an interesting alternative compared to restricted-use compounds.

Key words: Peroxidase, kinetic parameters, SDS, reducing agent, cyclodextrin.

Acknowledgements: This research has been supported by the Fundación Séneca under project PFE-SENECA/06/10.

PO3266

FURAN AND PRECURSORS IN CANNED VEGETABLES AND FRUIT JUICES

E. Guerra-Hernández[1], J. Aguilera[1], B. García-Villanova[1]

[1]Dpto. Nutricion y Bromatologia, Universidad de Granada, Granada, Spain

Background and Objectives: Furan is a potentially carcinogenic compound formed in heat processed foods. The content of furan, precursors [ascorbic acid (AA), carotenoids, hydroximethylfurfural (HMF) and furfural (FUR)] and pH have been studied in vegetables and fish canned and fruit juices with the objective to establish relations between furan, precursors and heat damage.

Methods: twelve samples of vegetables and fish and thirteen of fruits have been studied. In vegetables and fish canned was analyzed the food (F) and the liquid medium (L). The furan was determined by HS-GC-MS. Ascorbic acid, HMF and furfural were analyzed by HPLC-UV and carotenoids by colorimetric at 435 nm.

Results: The mean value of furan in vegetables canned was 11.4 μg/kg and ranged between non-detected in peppers and 26.7 μg/kg in cauliflower. The furan content in the liquid medium of canned was higher than food (50.7 μg/kg, mean value). The average contents of AA and carotenoids in the vegetables canned were 6.8 mg/100g and 968 mg/kg respectively. High correlations were obtained between furan (F)-furan (L), AA (F)-AA (L), furan (F)-pH (F), furan (F)–carotenoids (F), furan (F)-HMF (F), furan (F)-furfural (F) and HMF (F)-furfural (F). The furan content in juices ranged between no-detected in cranberry and pink grapefruit and 58.9 μg/kg in lemon; mean value of juice fruit was 13.1 μg/kg. High correlations were also obtained between furan and carotenoids and HMF and pH. The high value of furan in lemon juice may be due to the addition of â-carotene (label information). If the lemon sample is excluded correlations between furan-HMF and furan-furfural were obtained too.

Conclusions: carotenoids, acid ascorbic degradation (measure by furfural), heating intensity (measure by HMF) and pH are the principal factors in the generation of furan in canned vegetables.

Key words: Furan, furan precursor, canned vegetables, fruit juices.

PO3267

ACRYLAMIDE FORMATION IN DIFFERENT BATTER AND BREADING FORMULATION DURING DEEP-FRYING OF ZUCCHINI AND EXPOSURE ESTIMATION

E. Guerra-Hernández[1], R. Plata-Guerrero[1], B. García-Villanova[1]

[1]Dpto. Nutrición Y Bromatología. Universidad de Granada, Granada, Spain

Background and Objectives: Acrylamide, a probably human carcinogenic, is found to be formed in a wide range of fried foods. Maillard reaction is proposed as the most probable mechanism for the development of acrylamide formation in cooked foodstuff and asparragine and reducing sugars the precursors. Potatoes, cereals and coffee are the principal sources of human exposition. Acrylamide can be generated by domestic cooking (mainly by deep frying) and the previous studies have been carried out in fried potatoes and toasted bread. The objective of this work was studied the contribution of batter and breading procedure on acrylamide formation and estimate the intake by serving.

Methods: Zucchini were cut into in sticks and batter with flour, flour-water, flour-milk or flour-egg and breaded with breadcrumbs-egg or breadcrumbs-egg-flour. Four flour types (wheat, rice, chickpeas, wheat-corn) and two types of breadcrumbs (different size particle) were used. Frying was realized in deep frying with sunflower oil at 190°C and less than 4 min until achieve acceptable organoleptic characteristics.

Results: The mean value of acrylamide was 1941 μg/kg and ranged between 590 μg/kg for batter zucchini with wheat flour-water and 4167 μg/kg for batter zucchini with rice flour-egg. In

general, the samples with egg exhibited the highest acrylamide contents and the breading products showed minor values than batter products.

Conclusions: According to batter formulation for the same type of flour (wheat flour), the intake of acrylamide per serving (120 g) were 5 µg (flour-milk), 14 µg (flour-water), 42 µg (flour) and 83 µg (flour-egg); this values almost triplicate the acrylamide exposure estimated for the Spanish population (30 µg).

Key words: Acryalmide, batter formulation, breading, exposure estimation.

PO3269

MAILLARD REACTION IN THE STANDARD DIET FOR TYPE 2 DIABETIC PATIENTS

B. García-Villanova[1], J. Rodríguez Blanco[1], M. Fernández Álvarez[1], I. Ruiz González[2], T. Guardia Archilla[2], A. González Jiménez[2], M L. Fernández Soto[2], R M. García-Estepa[1], E. Guerra-Hernández[1]

[1]Department of Nutrition and Food Science, Faculty of Pharmacy, University of Granada, Granada, Spain
[2]Endocrinology and Nutrition Unit, University Hospital San Cecilio, Granada, Spain

Background and Objective: Dietary Maillard products may influence biological advanced glycation endproduct levels and promote inflamatory reactions in people with diabetes. Design, development and evaluation of a standard diet for metabolic control of type 2 diabetic pacients and valuation of Maillard reaction intensity in the diet foods.

Methods: Diabetes meal planning was carried out according recommendation to diabetic pacients. Exchange system was used to design a diet of 1600 kcal, low cholesterol and energy profile (50% carbohydrates, 20% proteins, 30% fats); 7-days menus were planned and twenty dishs were cooked (soft conditions) and after freezze-dried and analyzed. Chickpeas boiled (30, 100 and 175 min) and ten individual vegetables were also studied. Furosine, furanic compounds (hydroximethyl-furfural and furfural) and glucosylisomaltol were determined by HPLC and UV detector.

Results: Studied foods were grouped into 5 categories, dairy, stews and casseroles, soups, protein food (eggs, pork, fish), carbohydrate foods (potatoes and pasta), vegetables, and cereals. Maillard reaction was detected in all cooked food. The furosine values ranged between 4-490 mg/100 g protein. The foods with highest damage thermic were omelette, York ham, cheese, dairy, pasta and vegetables soup. HMF values ranged between 0.03 and 1.49 mg/kg. Carbohydrate foods (potatoes and pasta) exhibited the highest values oh HMF. The boiled vegetables showed a furosine range between 15.5-83.9 mg/100 g proteins and Maillard reaction wasn´t observed in boiled chickpeas.

Conclusions: Maillard reaction was detected in all the cooked foods; however, average intake of HMF was 0.107 mg/day according to a soft cooking process.

Key words: Diet, diabetes, Maillard.

PO3270

EVALUATION OF MAILLARD REACTION IN THE DIET FOR TYPE 2 DIABETICS APPLYING INTENSE HEAT TREATMENT

B. Garcia-Villanova[1], M. Fernández Álvarez[1], J. Rodríguez Blanco[1], R M. García-Estepa[1], E. Guerra-Hernández[1], I. Ruiz González[2], T. Guardia Archilla[2], A. Gonzalez Jimenez[2], M L. Fernandez Soto[2]

[1]Department of Nutrition and Food Science, Faculty of Pharmacy, University of Granada, Granada, Spain
[2]Endocrinology and Nutrition Unit, University Hospital San Cecilio, Granada, Spain

Background and Objects: Intense heat treatment (frying, grilling, roasting) produces Maillard reaction compounds. Dietary Maillard products may influence biological advanced glycation endproduct levels and promote inflamatory reactions in people with diabetes. Evaluation of Maillard reaction intensity in the diet foods designed and evaluated for metabolic control of type 2 diabetic pacients.

Methods: Diabetics meal planning was carried out according recommendation to diabetic pacients. Exchange system was used to design a diet of 1600 kcal, low cholesterol and energy profile (50% carbohydrates, 20% proteins, 30% fats). Twenty eight foods were selected for one week diet. Twenty three dishes were cooked by frying, grilling, roasting and boiling. Furosine, furanic compounds (hydroximethyl-furfural and furfural) and glucosylisomaltol were determined by HPLC-UV.

Results: Studied foods were grouped into 6 categories, dairy, stews and casseroles, soups, protein food (eggs, pork, beef, fish), carbohydrate foods (potatoes, pasta, rice, croquettes), vegetables, baked products and others group. The furosine values ranged between 0.6-615 mg/100 g protein. The foods with highest damage thermic were foods with milk, cheese and egg cooked by gratin, roasted or grilled. HMF values ranged between 0.02-101 mg/kg dried matter and drink coffee, 360 mg/kg fresh matter. Fried or toasted bread and grilled vegetables were the products with highest content. Average intake of HMF was 38.5 mg/día and 2.56 mg/kg if the drink coffee isn't considered.

Conclusions: The formation of Maillard compounds in cooked dishes depends not only of heat treatment but the ingredients used in the recipe. Eggs, milk and dairy products increase considerously these compunds.

Key words: Diet, diabetes, Maillard, domestic cooked.

PO3271

FACTORS MOTIVATING HOME GARDEN CHOICES AFFECTING DIETARY DIVERSITY IN BANGLADESH

T. Schaetzel[1], M. Antal[1], A. Guyon[2]

[1]The Manoff Group, Washington, DC, USA
[2]SPRING-John Snow, Inc, Rosslyn, VA, USA

Background and Objectives: Home gardens can improve the agrodiversity of smallholder farms, and the dietary diversity of families inhabiting them. The USAID-supported SPRING nutrition project promotes practices to maximize dietary benefits afforded by home gardens, including year-round production, cultivation of nutritious crops, own-consumption (versus sale), and use of garden-based income to purchase nutritious foods. Smallholders will adopt these practices only if they appeal to individual motivations, and other than the obvious economic concerns little is known about motivations behind crop choice, consumption vs. sale, or purchase. The objective of this study is to investigate the motivations for choices related to home gardening to inform development of behavior change communications to promote greater agrodiversity and dietary diversity.

Methods: In-depth interviews were carried out with 100 husband-wife pairs participating in home gardens in 2 Districts in Bangladesh. Respondents were asked about factors that influence their decisions about crops to plant in a garden, sale or consumption of produce from their garden, and purchases using proceeds from sale of garden produce. In addition to indicating which factor was "most important", subjects rated specific factors on an importance scale ranging from 1 to 3. Respondents also indicated which family member has primary authority for each decision. Promotional approaches were developed portraying positive agrodiversity and dietary diversity practices to appeal to personal motivating factors, targeting the household member most responsible for each decision.

Results: Results of the factor rating will be presented, as well as the promotional approaches developed and their implications for SPRING programs.

Conclusions: Nutrition may be a potent motivating factor for some choices related to home garden production, but other factors are as or more important and should be considered when promoting improved agrodiversity and dietary diversity among home gardening households in Bangladesh.

Key words: Home gardens, dietary diversity, behavior change communications.

PO3272

DIETARY FIBRE AND PROXIMATE COMPOSITION OF SOME SELECTED GHANAIAN UNDERUTILISED FRUITS

A. Boakye[1], I. Oduro[1], F. Wireko-Manu[1]

[1]Kwame Nkrumah University of Science and Technology, Kumasi, Ghana

Background and Objectives: Intake of dietary fibre (df) is postulated to be inversely related to the occurrence of colorectal cancer and obesity with a recommended daily intake (RDI) of (21 - 38) g depending on age and sex. European Union regulations on health and nutritional claims, allows for food with at least 6 g of df per 100g to be labelled as high in df. There is dearth of literature on the df composition of Ghanaian indigenous fruits to substantiate related health potential. This paper seeks to document the df fractions and proximate composition of four selected popular but underutilised fruits viz., Irvingia gabonensis (African mango; pulp and seeds), Artocarpus altilis (breadfruit; pulp), Annona muricata (soursop; pulp) and Annona squamosa (sweetsop; pulp).

Methods: Edible portions of commercially matured fruits were freeze-dried and stored at –20°C prior to df analysis and the fractions obtained by an enzymatic-gravimetric procedure. The proximate analysis was done by standard methods.

Results: The total df contents recorded for the samples ranged between 11.50 and 22.70 g/ 100g with the least observed in sweetsop while African mango (pulp) recorded the highest. The samples showed higher insoluble df fractions than the soluble components with African mango (pulp) recording the highest insoluble value of 18.00 g/100g (soluble fraction: 4.71 g/100g) and breadfruit with the least value of 8.01 g/100g (soluble fraction: 3.66 g/100g). Highest soluble fraction, 7.35 g/100g, was recorded in African mango (seeds) (hull included). Crude protein ranged from (2.63±0.11 to 6.71±0.07)%, fat (2.60±0.41 to 13.90±0.58)%, crude fibre (2.09±0.29 to 13.51±2.15)% and ash (2.44 ±0.07 to 4.00±0.03)%.

Conclusion: The df values obtained show the potential of these fruits significantly contributing to consumers meeting the RDI for df. Also, the appreciable protein and ash contents may well serve health-conscious individuals.

Key words: Dietary fibre, health, underutilised fruits.

PO3273

INTEREST FOR NATURAL PRODUCTS AMONG BRAZILIAN YOUNG WOMEN IS RELATED TO CONCERN ABOUT HEALTHY EATING

P. Koritar[1], S T. Philippi[1], M S. Alvarenga[1]

[1]Faculdade de Saúde Pública, Universidade de São Paulo, Sao Paulo, Brazil

Background and Objectives: Healthy eating attitudes could enclose consuming natural products, free of agrotoxics and additives, but not necessarily all people see it as a healthy diet practice and it could vary among different groups. The purpose of this study was to evaluate the relation between interest about natural products and concern about adopting a healthy diet among young women.

Methods: Brazilian female undergraduates (n=146) and patients over eating disorders (ED) treatment (n=26) aged from 18 to 40 years-old, answered the sub-scales General Health Interest and Natural Product Interest from the Health and Taste Attitude Scale. They related age and the nutritional status were assessed by means of Body Mass Index (BMI). Correlation between General Health Interest and Natural Product Interest were assessed by Pearson correlation coefficient. Multiple comparisons between patients and college students (just those without ED risk behavior evaluated by the Eating Attitude Test) were assessed by Tukey's test.

Results: Undergraduates were on average 22.5 years old (SD 4.2), 78.1% had normal range weight and 20.5% presented risk to ED. Patients were on average 25.9 years old (SD 6.6), 84.6% had bulimia nervosa, and 53.8% were overweight. Natural Product Interest score was similar between groups and it was positively correlated with General Health Interest score for both [0.418 for undergraduates and 0.636 for patients ($p < .001$)].

Conclusions: Interest in eating unprocessed foods that do not contain additives was related with interest in eating h ealthily for Brazilian young women despite an ED presence.

Key words: Health, organic food, women, eating disorders.

PO3274

EFFECT OF ELECTROLYZED WATER ON FERMENTATION OF GLUTEN-FREE RICE BREAD

T. Yamaguchi[1], Y. Watanabe[1]

[1]Fucalty of Education, Niigata University, Niigata, Niigata, Japan

Background and Objectives: Rice is one of the most important cereals in Asian countries, especially in Japan. Niigata is a famous area for rice-growing, and produce new type of rice flour suit with bread making. Rice is also good for wheat allergy patients, because of absence of gluten. We have investigated to produce gluten-free rice bread using hydroxylpropylmethyl cellulose (HPMC). In the field of food science and technology, water is an important ingredient influencing taste, rheology and preservation of foods. In addition, it is known that electrolyzed-reduced water scavenges active oxygen species and protects DNA from oxidative damages. The aim of this study is to evaluate the effect of electrolyzed water on the fermentation of batter of gluten-free rice bread.

Methods: Batter of gluten-free rice bread was prepared with rice flour (Koshihikari), olive oil, sugar, salt, dry yeast, and HPMC. Electrolyzed water obtained by the electrolysis of tap water and pure water were used. Water content of batter against rice flour changed to 70, 80, 90, 100, 110%. Fermentation of the batter were measured at 25, 30, 35, 40 °C for 120 min.

Results: Fermentation of the batter of gluten-free rice flour advanced at higher temperature. 70% water content batter of pure water fermented earlier than the other batters at 35 and 40 °C, but there were no significant differences between water content of batter on the fermentation at 25 and 30 °C. When electrolyzed water was used, well fermentation observed in 70 and 80% water content of batter at 25 °C. However, gluten-free rice bread prepare by pure water was preferred to that of electrolyzed water on the sensory evaluation.

Conclusions: These findings show that fermentation of the batter of gluten-free rice flour with electrolyzed water advanced at lower water content and temperature.

Key words: Rice bread, fermentation, water.

PO3275

REGULATION (EC) Nº 1924/2006 ON NUTRITION AND HEALTH CLAIMS MADE ON FOODS: FISH AND SEAFOOD CONSUMPTION PROMOTION IN SPAIN

T. Valero[1], E. Ruiz[1], S. del Pozo[1], J M. Ávila[1], G. Varela-Moreiras[1, 2]

[1]Fundación Española de la Nutrición (FEN), Madrid, Spain

[2]Universidad CEU San Pablo, Madrid, Spain

Background and Objectives: Due to the importance of including fish and seafood in our diet, the Spanish Nutrition Foundation (FEN), in collaboration with the Spanish Ministry of Agriculture, Food and Environment (MAGRAMA) has evaluated this food group in accordance to the Regulation (EC) No 1924/2006 on nutrition and health claims made on foods. The objective was to classify 75 fish species (52 fish, 17 seafood and 6 canned fish & seafood) included in Web Database based on nutritional composition and economic cost of fish and sea-

food (http://www.fen.org.es/magrama/calculadornutricional/index_App.html), according to current EFSA legislation.

Methods: It has been consulted several food composition tables (Moreiras y col. 2010; Martin G. 1997; Ortega y col. 2011; Mataix y col. 1998; USDA National Nutrient Database for Standard Reference, Relase 24 (2011)) to obtain nutritional data for this food group. These data has been used to calculate the conditions included in EFSA legislation in order to evaluate nutrition claims achievements.

Results: All the fish species with available data are "source of/contains" protein, phosphorous and omega 3 and "high" protein. In case of "source of/contains" selenium, vitamin B12 and "high" selenium, all of them follow the regulation, except two. More than 50% of fish species are "source of/contains" vitamin B6 and "high" niacin, phosphorous and omega 3. Finally, more than 70% of fish species are "low" fat and sugars, "sugars-free", "source of/contains" vitamin D, niacin and vitamin B12, and "high" vitamin D and B12. All species could use the term "naturally/natural" as a prefix to the claim.

Conclusions: Classify the fish and seafood group in accordance with the regulation (EC) No 1924/2006 on nutrition and health claims made on foods could provide information to assist consumers in making natural healthy food choices using these nutritional claims in advertising and food labeling.

Key words: Claims, fish, seafood.

PO3276

FOOD AND NUTRITION ASSEMENT IN AFRICAN RURAL COMMUNITIES(UGANDA CASE)

E. Namutebi[1], R. Kate[2], D. Namudu[3]

[1]Safe Citizens Uganda Foundation, Kamapala, Uganda
[2]Busoga University, Iganga, Uganda
[3]Agriculture Reasearch Institute, Kawanda, Uganda

Background and Objetive: An exploratory study of a rural community of the Busoga Sub- region of Uganda, assessed community nutrition problems and formulated recommendations for nutritional improvement.

Methods: The study emphasised the importance of personal interviews and group discussions over questionnaires in discovering the opinions of village people on particular issues.

Results: Through open-ended surveys and discussions, in-depth information was obtained on agricultural patterns, food habits, food-storage and marketing practices, infant-feeding practices, and cultural beliefs and taboos. Secondary data on health facilities, food-distribution systems, and nutrient-supplementation programs were taken from government sources.

Conclusions: The final section includes four major recommendations for nutritional improvement in the Basoga community: 1) Anthropological methodologies should be used to analyse the food and nutrition situation and to determine root causes of malnutrition at the community level. 2) Storage techniques and marketing strategies must be improved and the food policy reframed in light of specific regional needs. 3) The effect of modernization in agriculture must be reanalyzed to assess its impact on women labourers, to improved nutritional status through active participation, and grass-roots organizations must be encouraged to motivate people especially women's groups.

Acknowledgments: Many technical and non-technical persons contributed to the completion of this study. We wish in particular to thank to: Ms. J. Babirye Ntende, District Community Development Officer Iganga/Bugiri District; Mr. E. Kirenda, Chief Executive Officer; and Dr S. Olaka, District Health Officer. We also greatly appreciate the untiring work of the field assistants who, in adverse conditions, often stayed in the villages until sundown. Our greatest appreciation. Without their cooperation a clear understanding of their needs could not have been attained. We also appreciate the efforts of Ms Helen Nakato, who painstakingly typed several drafts.

PO3277

MICROBIOLOGICAL STABILITY OF COOKIES FORMULATED WITH CASHEW APPLE POWDER

A. Bravo[1], J. Puentes[1], M. Amaro[2], W. Colina[3], T. Mesa[1], D. Villalobos[1], J. Mejia[1], E. Reyna[1]

[1]Laboratory of Research and Development in Nutrition (LIDN), University of Zulia, Zulia, Venezuela
[2]Department of Bromatology and Food Technology, University of Cordoba, Cordoba, Spain
[3]Laboratory of Analytical Instrumentation (LIA), University of Zulia, Zulia, Venezuela

Background and objectives: Wheat flour is a basic ingredient which is imported into Venezuela, so that foodstuffs formulated with this raw material are more expensive. Therefore, the use of cashew (Anacardium occidentale L) apple powder as an extender in the baking industry to replaced wheat flour, it is feasible alternative to reduce production costs and to formulate healthy foods for human consumption. The purpose of this study was to determine the microbiological stability during 21 days of storage in three formulations of cookies made with cashew apple powder.

Methods: Cashews (red creole type) were collected in Villa del Rosario de Perija, Zulia State, Venezuela. Pseudofruits were oven drying (48 hours at 65°C) and the material obtained was ground, sieved and packed in bags. Formulations of cookies

were prepared from cashew apple powder (CAPC) at 10%, 20% and 30% by substitution of wheat flour. Others ingredients as vegetable fat, water, egg and sweetener (sucralose) were used. A cookie formulation was made from 100% wheat flour to serve as a control (WFC). Cookies were stored in an environment with moderate light at 24°C and 35% humidity for 21 days. Yeasts and molds were determined according to COVENIN methods 1337/1483.

Results: The 10% and 20% CAPC formulations showed <1 log cfu/g for yeasts and molds after 15 days of storage, but before 21 days the growing was found countless. The formulations with 30% CAPC and WFC showed the same microbiological behavior for yeasts and molds, with <1 log cfu/g after 15 days of storage and increasing to 1 log cfu/g after 21 days of storage.

Conclusions: The formulation of cookie with 30% of cashew apple powder had the best microbiological stability, which makes it acceptable for human consumption.

Key words: Anacardium occidentale L, cashew apple powder, cookies, microbiological stability, storage.

PO3278

WHAT A CITY COUNCIL CAN DO TO IMPROVE THE QUALITY OF LIFE IN THE ELDERLY?

M A. Roset-Elias[1], E. Cardeña-Franquet[2], I. Puigdueta-Lucas[3], M. Obea-Masó[4]

[1]Commissioner With Responsability For Senior Citizens At Barcelona City Council, Barcelona, Spain
[2]Adviser Personnel For Senior Citizens At Barcelona City Council, Barcelona, Spain
[3]Official College of Pharmacists. Barcelona, Barcelona, Spain
[4]Assistant For Senior Citizens At Barcelona City Council, Barcelona, Spain

Introduction: The elderly citizens (older than 65 year) living in Barcelona, 338,000 people, represent 20.8% of the total inhabitants (1,600,000). Some of them (26%) live alone and their life expectancy is 85.0 years (women) and 79.3 (men). The Barcelona City Council is member of the World Organisation Global Network of Life Friendly Cities. In 2012 the recommendations of the City Council laid special stress on health, eating habits and physical activity. Goals: Setting the old people from Barcelona and their longevity as a priority in the Municipal Plan for the elderly over the period 2013-2016.

Material and Methods: District programmes for active ageing and promotion of old people giving social priority to meals, nutrition and physical activity.- Cooperation strategies: (Municipal areas, districts, associations, voluntary services, professional sphere).- Promoting good healthy habits and physical activity. Leisure centres, neighbourhood and professional associations (Pharmaceutical Association, health centres).- Production and distribution in cooperation with different institutions of leaflets offering guidance to old people on safety and/or nutrition - (Barcelona Public Health Agency, epidemiology services).- Production of guidelines on nutrition, physical activity and sport (Food conditions: well-balanced and a varied diet planning which can be adapted to people's personal habits - ensuring nutritional safety at any time.

Results: 1) Experiences related to nutritional needs of vulnerable population. Meals sharing with other people, dining premises designed to be used both as a place for meals and for socialising. Home-delivered meals for disabled people. Residential homes: Nutrition monitoring for long-term residents. 2) Experimental work to promote physical activity among old people. Municipal programme of outdoor gymnastic circuits (two in each district) and subsequent follow-up action and evaluation.

Conclusions: Commitment to make progress in building up a city which fully accepts the challenge of ageing and cares for the old people who need to be attended to as they become vulnerable.

Key words: Safety and/or nutrition, Vulnerable population, Physical activity, Nutrition monitoring.

PO3279

NUTRIENT COMPOSITION STUDIES ON MARGINALISED LANDRACES OF RICE, MAIZE, SORGHUM AND KIDNEY BEAN COLLECTED FROM FRAGILE ECOSYSTEMS OF INDIA

R. Bhardwaj[1], J C. Rana[1], N K. Dwivedi[1], S R. Pandravada[1], O S. Ujjlain[1], C S. Raghav[1], M. Dutta[1], I S. Bisht[1], K C. Bansal[1]

[1]Indian Council of Agricultural Research, Delhi, India

Background and Objectives: Green revolution driven by high yielding varieties has resulted in drastic reduction of area under crop landraces. However, they are still cultivated on marginal lands by farmers primarily for their own consumption because of their perceived nutritional superiority and/or taste attributes and tolerance to biotic/abiotic stresses.

Methods: Unique landraces of rice (12), maize (32), sorghum (9) and kidney bean (15) collected from ethnic communities residing in remote and fragile agro-ecosystems, under the World Bank funded NAIP (GEF) project were analysed for proximate composition, starch, sugar, phenols, antioxidant capacity, phytate and minerals following AOAC methods.

Results: Protein content of rice, maize, sorghum and kidney bean ranged between 6.7%-10.4%±1.12, 8.7%-12.01%±0.94, 11.3%-13.8%±0.88, 21.3%-25.1%±1.12 while starch con-

tent ranged 63.8%-69.6%±1.59, 48.8%-64.9%±3.95, 49.04%-66.51%±6.14, 23.8%-35.3%±4.61, respectively. Highest variability for protein content was observed in rice and for starch in maize and kidney bean landraces. Total soluble sugar content was highest in kidney bean (22.7%-26.7%±2.05) but maximum variability was observed in maize (3.4%-11.1%±1.72). Fat content as well as variability was highest in maize (3.7%-7.96%±1.16) followed by rice (2.7%-4.7%±0.67) and sorghum (1.9%-4.6%±1.03). Kidney bean showed highest mineral content followed by sorghum. Total dietary fibre was highest in sorghum but soluble dietary fibre was highest in kidney bean. Antioxidant activity (GAE) estimated by CUPRAC assay was found to be highest in kidney bean landraces Rajma Him (5.3±0.06), Rajma Chamba (5.11±0.05) followed by red rice land races Begmi (4.98±0.05) and Kathedi (4.88±0.06). Antioxidant activity of sorghum landrace Vayunowka Jonna (3.82±0.04) was more than double compared to other land races and varieties.

Conclusion: Most of the land races showed high proportion of fibre, minerals, phenols, antioxidant potential and lower content of starch/sugar as compared to commercial varieties. Thus landrace diversity offers opportunity to combat emerging public health issues such as micro-nutrient deficiencies, diabetes, CVD, cancers and to conserve diversity and environment.

Key words: Landraces, nutrient composition, antioxidant potential, phytate, minerals.

PO3280

PHYSICOCHEMICAL PROPERTIES OF SOME HONEY PRODUCED IN THE UNITED ARAB EMIRATES

I. Achouri[1], Y. Aboussaleh[1]

[1]Ibn Tofail University , Kenitra, Morocco

Background and Objetives: This study focuses on the determination of physicochemical properties of 70 local honeys from two different types (Sider and Samar) obtained in the United Arab Emirates.

Methods: In this study, water content, pH, acidity, electrical conductivity (EC), colour,hydroxymethylfurfural (HMF) and sugar content were all determined in different types of bee honey.

Results: The analysis shows that all samples are acid, with relatively low water content (Sider= 17.35, Samar= 15.92). The values obtained for the electrical conductivity are comparable. A small variation is observed due to the floral origin. The determination of the sugar content, revealed the presence of large quantities of fructose compared to glucose in all samples. Percentage of Sucrose is very low (Sider=3.24, Samar=2.58). According to this analysis the level of HMF in the majority of the analyzed samples is low showing that our local honey is fresh, and meet national (UAE.S GSO 147:2008) and international standards (codex Alimentarius 2001). The rest of the local samples show significantly high HMF levels. These results may therefore be attributed to storage for long periods at high temperatures or adulteration.

Conclusions: the result of this study indicated that Sider and Samar honey differ significantly in their physico-chemical properties. Honey samples purchased from two different region of United Arabs Emirates, were mostly at good quality, but honey type Sider is the best.

Key words: Honey, Samar, Sider, physicochemical characteristics.

PO3281

GENETICALLY MODIFIED FOOD PLACED ON THE POLISH MARKET IN THE YEARS 2007-2010

I. Traczyk[1], A. Walkiewicz[1], M. Jarosz[1]

[1]Department of Nutrition and Dietetics with Clinic of Metabolic Diseases and Gastroenterology, National Food and Nutrition Institute, Warsaw, Poland

Background and Objectives: European Union (EU) legislation ensures that accurate information concerning genetic modification is available at each stage of production and placing on the market of food. Indication on the label information concerning that modification can enable consumers to make an appropriate choice between traditional and genetically modified (GM) food. The objective of the study is to analyse of labelling correctness of potentially genetically modified foodstuffs.

Methods: The food samples were taken from the Polish market according to annual sampling plans for monitoring purposes (in the years 2007- 2010) and examined by State Sanitary Inspection's laboratories paying special attention to presence of GM material and if that modification is approved in EU. Data analysis of food samples tested was conducted based on results from that laboratories.

Results: In the years 2007-2010, 2433 samples of various foodstuffs were taken from Polish market in the direction of checking of labelling correctness, in relation if products have information about genetic modification on the label and if that modification is approved. It turned out that in mentioned period 27 products were identified as containing GM material and without any indication of information concerning genetic modification (1,1% of food samples examined). 25 products contained modification approved in EU. 2 genetically modified samples contained modification, which was not allowed in the EU (flax products).

Conclusions: Ensuring a basic for consumers to make informed choices of food that they consume is very important.

The accuracy of labelling in accordance with EU regulation gives consumers possibility of such a choice and can build trust to that food. Taking into account the results of food monitoring there is need of continuation of that procedure.

Key words: Genetically modified food, labelling, correctness.

PO3282

ANALYSIS OF WASTE IN A RESTAURANT FOOD INDUSTRIAL MARANHÃO - BRAZIL

N. Cabral[1], A. Veloso[1], E. Hortegal[1], M. Rocha[1]

[1]University Ceuma, Sao Luis, Brazil

Background and Objectives: to verify food waste in a restaurant industry, analyzing and determining the amount of leftover clean to calculate the financial impact of leftovers to food and nutrition unit.

Methods: It is a field study descriptive. The survey included data collected between October and November 2012, for nine days in the morning. The weighing of the Clean Surplus distribution was performed after lunch. Leftovers preparations were weighed separately and these values were recorded and compared to the values of meals served. To analyze the remains clean, tables were used to show the percentage of clean leftovers on the total weight of food produced, the unit cost of the raw material and the unit cost of the clean surplus. The cost calculation was based on the main ingredient spending.

Results: It was found that the average per capita of the total surplus was 116 grams, equivalent to 22,3% of a given quantity of consumption, which exceeds 20% of the margin of safety provided in the planning of the Food and Nutrition Unit.

Conclusions: The unit of food and nutrition presented a safety margin above planned, wasting a considerable loss of food with plenty clean.

Key words: Food-Processing Industry. Food Economics. Food Production.

PO3283

QUANTIFICATION OF ANTINUTRITIONNAL SUBSTANCES IN THE FRUITS OF GLEDITSIA TRIACANTHOS L. IN ALGERIA

B. Samia[1], C. Kheira, B. Hachemi

[1]Laboratory of Vegetal Biodiversity, Conservation & valorization, Faculty of Sciences, University Djillali Liabes of Sidi Bel Abbes, Algeria

Background and Objetives: Honey locust (Gleditsia triacanthos), also called sweet-locust or thorny-locust, is a moderately fast growing tree commonly found on moist bottom lands or limestone soils. It was largely recommended like food of the cattle at the beginning of the 20 Th centuries, since it can provide a source of fodder, protein and metabolic energy. The tree was introduced in Europe in 1700 when it became current in the Western areas, central and Southerners, and was introduced by the colonists into our country Algeria in 1949. We aim to quantify antinutritionnal substances in the fruits of gleditsia triacanthos l. in Algeria.

Methods: The pods of G. triacanthos L. were collected from the University of Djillali Liabes (ITMA) Sidi Bel Abbes during November 2011. The pods were put to dry in the shade during 3 months. The seeds were separated manually then crushed separately. We carried out following proportioning: total phenols, condensed tannins, hydrolysable tannins.

Results: The obtained results showed that the fruits of G. triacanthos are characterized by very low values in anti-nutritionals factors with the percentages according to: condensed tanins (0, 13% - 0, 03%), hydrolysable tanins (0, 78% - 0, 45%) and total phenols (0, 44% - 0, 16%).

Conclusion: It arises that the fruits (pods and seeds) are a promising source which can be of a great interest for the industry by its use for example in the manufacture of bioethanol and cattle food.

Key words: Gleditsia triacanthos L., pods, seeds, anti-nutritionals factors, valorization.

PO3285

HEALTH BENEFIT CLAIMS AND DAIRY PRODUCTS

Z. Du Plooy[1], H C. Schonfeldt[1,2], N. Hall[1,2], H. Vermeulen[3]

[1]Institute of Food, Nutrition and Wellbeing, University of Pretoria, Pretoria, South Africa
[2]Department of Animal and Wildlife Sciences, University of Pretoria, Pretoria, South Africa
[3]The Bureau for Food and Agricultural Policy, University of Pretoria, Pretoria, South Africa

Background and Objective: International authorities in different parts of the world made it their mandate to ensure all health benefit claims made on food labels are clear and scientifically substantiated. In South Africa, as in many other countries in the world, local authorities' govern labeling legislation, regarding which international guidelines should be followed and ultimately what health benefit claims are allowed to appear on food labels.

Methods: A comparative analysis was done by observing and comparing South African health benefit claims on dairy products in 2009 with those in 2013. An analysis of internationally approved health benefit claims were also done and compared to current claims on South African dairy products.

Results: Since 2009 food labeling legislation in South Africa has changed considerably. Nutrient content and comparative claims are allowed under the Labeling and Advertising of Foodstuffs regulations, whilst a restriction was put on functional health claims. Further more, the recently published Consumer Protection Act together with the above labeling regulations, demands that any claim made on a product must be scientifically substantiated Substantiation must be provided within two days upon request by authorities. Nutrient content claims are more standardized than in 2009, with prescribed levels and wording. Strict guidelines determine the sampling and method of analysis for nutrient profiling for labeling purposes. All of the above affects dairy product labels.

Conclusion: International authorities, which allow for functional claims on dairy products, base approval of such claims on science-based nutrient profiling, ensuring all claims are substantiated. From a nutrient profiling perspective, it is thus evident that South Africa is aligning itself with the rest of the word in terms of food labeling. Global and local health trends provide a unique opportunity for the use of health benefit claims and the development of fortified/enriched dairy products.

Key words: Legislation, health benefit claims.

PO3286

THE IMPACT MINIMALLY POSTHARVEST HANDLING OF FRUTS AND VEGETABLES ON FOOD SAFETY IN REMOTE AREA IN TIMOR - INDONESIA

J E R. Markus[1], D R. Nendissa[1]

[1]Faculty of Agricultural, Nusa Cendana University D.R Agroteknologi, Fakultas Pertanian UNDANA, Kupang, NTT, Indonesia

Background and Objetive: Postharvest handling is done to increase the quality of fruits and vegetables, however this cannot be done because a number of reasons. One of the reasons is cheap prices only can be accessed by the customers such in remote area and poor country such in Timor. Most people think that postharvest handling only wasting time, wasting money , on the other hand they forget that by handling, it can be increase the quality of products such fruits and vegetables and food safety aspects.

Methods: The reseacrh has been done in 7 tradisional markets in West Timor to indentify the postharvest handling technologies that applied to the local fruits and vegetables.

Results: It found that, there was no proper postharvest handling technologies applied to the fruits and vegetables, such washing or rinse with unqualify and unsafety water. It also found that most of the local horticulture product are sold without sorting or grading, no pre cooling treatment, the packing, and others steps of postharvest handling. While these commodities are displayed in wholesome marketplace are not packed, displayed without putting on the top of pallet even put directly to the floor or on the surface of land. These lead to unsafety and unhealthy conditions, and at the end customers got the unsafety fruits and vegetables which caused infections, diseases and others

Conclusion: It may be said that fruits and vegetables sold in the tradisional markets need to be handling properly before eating or cooking because of safety reasons.

Key words: Minimal process, postharvest handling, fruits, vegetables.

PO3287

IMPACT OF SUSTAINABLE PRODUCTION OF PALM OIL ON HOUSEHOLD LIVING STANDARD AND ENVIRONMENT: EXAMPLE OF APPLYING CONTRACT FARMING IN INDONESIA

L. Valešová[1], V. Verner[1], D. Herák[2], Dědková[3], S. Simanjuntak[4]

[1]Department of Economic Development, Faculty of Tropical AgriSciences, University of Life Sciences Prague, Praha, Czech Republic
[2]Department of Mechanical Engineering, Faculty of Engineering, University of Life Sciences Prague, Praha, Czech Republic
[3]Department of Sustainable Technologies, Faculty of Tropical AgriSciences, University of Life Sciences Prague, Praha, Czech Republic
[4]Department of Agriculture Economy, Faculty of Economy, University of Tapanuli Sisingamangaraja XII, North Sumatra, Indonesia

Background and Objectives: Environmental damages have negatively affected socioeconomic benefits of expanding palm oil industry in Indonesia. Small-holders are identified as the most vulnerable groups in the term of (i) falling into poverty traps due to using inappropriate practices and inputs, and, (ii) suffering from environmental degradation in rural areas. Contract farming is believed to have a potential to reduce negative impacts on environmental and to increase living standard of targeted farmers. The aim of the study was to analyze present situation and identify potentials for poverty alleviation and environmental conservation.

Methods: Study was carried out in North Sumatra. Review of available literature as well as interview with local administration and NGOs were gathered to determine the bottlenecks and potential benefits of using contract farming. Finally, group discussions were organized with local small-holders (n=45) on preferences regarding to additional income allocation.

Results: Both Indonesian government and local NGOs has a low awareness about positive aspects of contract farming on socioeconomic development and environmental sustainability. Small-holders under contract have a potential to increase the income approximately at 37%. Farmers themselves claimed additional income will be used on education for their children and ensuring food security for household members.

Conclusions: Under the assistance of both governmental and non-governmental organizations, contract farming seems to be a suitable solution for the Indonesian palm oil production as it has capacity to solve problems of both poverty alleviation as well as reduction of negative ecological impacts of the Indonesian palm oil industry on local environment.

Key words: Environment, palm oil, food security, living standard, North Sumatra.

PO3288

CHOICES PROGRAMME NUTRIENT PROFILING MODEL: EVALUATION OF LABELLED FOODS MARKETED IN ANKARA, TURKEY

D. Dikmen[1], G. Pekcan[1]

[1]Hacettepe University Faculty of Health Sciences Nutrition and Dietetics Department Ankara, Ankara, Turkey

Background and Objectives: The International Choices Programme (ICP) is an international applicable nutrient profiling system aimed to product reformulation and to help consumers to make healthier choices. The objective of this study was to use the ICP nutrient profiling model to test the labelled foods and beverages marketed in Ankara, Turkey.

Methods: Totally, 3184 labelled food and beverages from 38 food categories and 500 different brands which were marketed in top two hypermarkets were evaluated. All the foods and beverages were divided into food groups on the basis of ICP product criteria. The criteria for energy, fiber, saturated fatty acids (SAFA), trans fatty acids (TFA), sodium and added sugars were determined according to each of the food and beverages groups.

Results: According to the model energy criteria compliance with the fruit juices, main courses, filled sandwiches were 33%, 95.2% and 90.9% respectively. Fiber criteria compliance with fruit juices, pastas, rice, breads, breakfast cereals and main courses were 2.7%, 1.2%, 0%, 34.1%, 59.6% and 11.9%, respectively. Fruit juices, pastas, rice, grains, breads, breakfast cereals, cheeses, milk products, oils and fats and main courses were complied with the sodium criteria; 9.8%, 4.1%, 7.7%, 4.6%, 0%, 65.4%, 1.5%, 3.3%, 43.8% and 4.8% respectively. Out of total, 39% of the breads did not comply the sodium criteria. SAFA criteria compliance with pastas, breads, breakfast cereals, oils and fats and main courses were 16%, 24.4%, 71.2%, 88.8%, 16.7% respectively. Breakfast cereals sugar content (48.1%) was not comply the ICP.

Conclusions: Choices Programme nutrient profiling model is easy to evaluate the nutrient profiling of foods, but compliance of the criteria of foods and beverages marketed in Turkey is not satisfactory. Reformulation of the products is needed.

Key words: Labelling, nutrient profiling, Choices Programme.

PO3289

FOOD SECURITY AND THE DEVELOPMENT OF URBAN AGRICULTURE IN ACCRA, GHANA

C. Afful[1], T. Doucha[1]

[1]Department of Economic Development, Faculty of Tropical AgriSciences, Czech University of Life Sciences, Praha, Czech Republic

Background and Objetives: Rapid urbanization has led to poverty and eventually threatened the food security of Accra in Ghana. Accra, like most African cities has witnessed high migration from the rural areas since independence. Main actors in the creation and control of habitats like developers, government etc. in Ghana have long tried to put agriculture under rural living and not urban. For the urban dwellers poverty always lurk around the corner because of the over reliance on a cash economy and unemployment. Urban agriculture provides an alternate path to limiting this menace. The aim of the research was to (1) understand urban agriculture in Accra and its impact on the household, (2) highlight the importance of urban agriculture with regards to food security in Accra, (3) understand why there are no government backing and promotion of urban agriculture.

Methods: Data was collected during the summer of 2012 through face to face interviews and sometimes semi-structure questionnaires with some farmers in Accra who engage in urban agriculture and experts from the Ministry of Agriculture, Ghana.

Results: The most positive aspect with regards to urban agriculture and those who practice it in Accra was the stability in terms of household food supply, employment and subsequently income.

Conclusions: This work shows that with official backing urban agriculture may play a role on how the poor in Accra deal with poverty and subsequently food insecurity. Further, it will give an insight to policy makers and city planners on how embracing urban agriculture would help achieve the millennium development goal of poverty reduction, environmental sustainability and food security.

Key words: Accra, urban agriculture, Food (in) security, Ghana.

PO3290

PATHWAYS FOR SUSTAINABLE FOOD SAFETY

V. Iyengar[1,2]

[1]Biomineral Sciences, rockville, USA
[2]FSNSP Tufts University, Medford, USA

Globally, the notion of food safety (FS) has become a borderless unifying theme. Inadequate FS situation is recognized as direct threat to healthy living. Therefore, the impending long-term FS concerns call for mobilizing relevant expertise and resources needed to counter this task. Hence sustainable FS assumes special meaning. The national and international custodians of FS, are working on mechanisms for achieving such sustainable pathways with hopes of arriving at comprehensive yet functional FS practices. However, there is tacit admission that it is a complex problem. The requisites for management and communication to deal with different global regions and increasing demands on the scientific and technical competence, jointly influence the outcome. This is further complicated by the need to develop nationally and internationally acceptable FS standards and dissemination of such information to strengthen FS education. There are some positive developments too regarding FS outlook; e.g. (i) the HACCP also includes chemical and physical agents (not only microbiological), thus shifting focus on broader analytical requirements relevant for comprehensive FS; (ii) consumer insights into wholesome nutrition, fear of food adulteration, and of late, awareness of the geographic origin of foods due to prevalence of unsatisfactory food processing practices in some countries; and (iii) the fear of losing market share by export driven countries due to contaminated foods. These are important movements happening at a community level, demonstrating sustainable and positive FS trends. Looking forward, Australia, Canada, some European countries, Japan, and the USA, have evaluated existing and emerging FS risk factors (based on prevention, intervention and response), for consolidating FS gains. Finally, a recently proposed concept namely, Food Safety Security perceived as an early warning system for minimizing FS breaches, offers further insights (IJVNR 82(3), 2012, pp216-222). These and other pathways will be discussed.

Key words: Food safety, Food safety security, sustainable pathways.

PO3291

ASSESSMENT TOOL FOR EDUCATIONAL PROGRAM UNDER THE PERSPECTIVE OF PROMOTION OF FOOD AND NUTRITION SECURITY IN BRAZIL

J. Campos[1], K. Sávio[1], R. Akutsu[1]

[1]Nutrition Department, Faculty of Health Sciences,University of Brasilia, Brasilia, Brazil

Background and Objectives: For the full exercise of the human right to adequate food is necessary not only the design and implementation of programs and policies, but also the empowerment and participation of rights holders. Being the empowerment essential to the formulation, execution and monitoring of public policies and programs. The groups when excluded from decision-making processes that involve itselves

rarely maintain the access to adequate food for long time. The Thousand Women Program is inserted in Plan Brazil without Misery, and has as guidelines: improving access to education, contributing to the reduction of social and economic inequality of women, the promotion of social inclusion; defense of gender equality and, combating violence against women. This research has developed assessment tools to the Thousand Women Program with objective of evaluating the contributions of this in relation to promotion of food security and nutrition in Brazil.

Methods: It was performed a systematic review of the literature and from the theoretical basement tools were elaborated the instruments that present aspects related to the promotion, provision, protection and respect for the human right to adequate food.

Results: They were considered the dimensions concerning to the monitoring of the Food and Nutritional Security according to the National Food and Nutritional Security Council (production and availability of food, income and expenses with food, access to adequate food, health and health services, education, public politics, budget and human rights), the social economic profile demographic of the students (with information regarding education, income and housing, among others) and the state of food insecurity (according to the Brazilian scale of food insecurity).

Conclusions: from the application of these instruments will be possible to verify the impact of the professional qualification of these women in the food and nutritional security of their families.

Key words: Food and Nutritional Security, Empowerment.

PO3292

FEDERAL INSTITUTE OF EDUCATION, SCIENCE AND TECHNOLOGY GOIANO – CAMPUS CERES AND PROFESSIONAL QUALIFICATION OF WOMEN IN THE FIELD OF FOOD

J. Campos[1], R. Akutsu[1]

[1]Department of Nutrition, Faculty of Health Sciences, University of Brasilia, Brasilia, Brazil

Background and Objetive: The Brazilian Professional and Technological Education proposes a critical social intervention and qualified for favoring social inclusion and democratization of society social goods. The Program Mulheres Mil (Thousand Women) has among its guidelines: improving access to education, contributing to the reduction of social and economic inequality of women and the promotion of social inclusion. For this, the courses offered in the Federal Network of Technological Education in Brazil have a common core of subjects and some training. This paper aims to present the curriculum, the course of Practice and Food Processing, of the Federal Institute of Education, Science and Technology Campus Goiano Ceres.

Methods: For this work, a documentary search was conducted.

Results: the Common Core presents several disciplines: mathematics (20h), Portuguese (20h), entrepreneurship (10h), ethics and citizenship (10h) and data processing (20h). The professional part was designed by understanding the need of professional qualification, in accordance with the requirements of the National Health Surveillance Agency - ANVISA. Were taught the following subjects with their respective workloads: hygienic handling of food (10h), foodborne illness (10h), good manufacturing practices (30h), food contaminants (10h) and food processing (20h). The offered course developed theoretical and practical related to the knowledge mentioned, and in such diverse areas as: food and nutritional education, full use of food, bakery, best practices in processing fruits and frozen foods. The evaluation occurred through development of portfolio and monitoring the practical activities undertaken. Given the reports of the students, it was realized the change of habits, by incorporating knowledge, generating expectations of application of knowledge at home and in an own business.

Conclusions: From the results observed in the course had begun the develop tools and strategies to measure the impact of professional training offered by the program in the students' lives.

Key words: Professional qualification, Best Practices and Food Processing.

PO3293

DEVELOPMENT OF A METALLOPORPHYRIN COATED FOIL FOR THE DETECTION OF VOLATILE AMINES ORIGINATING FROM FOOD SPOILAGE PROCESSES

T. Bohn[1], N. Boscher[2], P. Heier[3], P. Choquet[2], L. Hoffmann[1]

[1]Environment and Agro-Biotechnologies Department, Centre de Recherche Public - Gabriel Lippmann, Belvaux, Luxembourg
[2]Material Sciences Department, Centre de Recherche Public - Gabriel Lippmann, Belvaux, Luxembourg
[3]Institute of Inorganic and Analytical Chemistry, Johannes Gutenberg-University, Mainz, Germany

Background and Objetive: Food spoilage processes decrease the nutritional value of products and may be a risk for the consumer's health. Fish and seafood products are consumed worldwide, but their shelf-life is limited due to various

bacterial activity resulting e.g. in the production of biogenic amines such as histamine, and volatile amines, resulting in off-flavours. Within this study, we purposed to develop a foil allowing us to detect volatile amines such as trimethylamine (TMA), dimethylamine (DMA) and triethylamine (TEA), that could be used in food packages as a colorimetric spoilage indicator.

Methods: Organosilicon films were loaded, among other, with chromium 5, 10, 15, 20-tetraphenylporphyrin (CrIIICl(TPP)H2O) by atmospheric pressure dielectric barrier discharge, and were investigated at various conditions for their ability to detect volatile amines and spoilage of fish in simulated storage experiments.

Results: In a first step, various metalloporphyrins (0.05% in ethanol) were tested in solutions, and CrIIICl(TPP)H2O was able to detect several volatile and biogenic amines, in the sequence TEA>TMA>DMA>NH3=cadaverine ($p<0.05$), as measured by absorption intensity shifts and a wavelength shift (ca. 6-9 nm) of the soret band at ca. 435 nm. Following optimization of the foil production to achieve a mesoporous surface, volatile amines could be detected down to ca. 100 ppm (dynamic mode) and down to ca. 1000 ppm (static), with no significant differences between TEA, TMA, and DMA while NH3 detection was >100 fold weaker. Subsamples (20 mg) of seafood fish (hake) of spoiled fish could readily be detected within 60 min.

Conclusions: Atmospheric plasma techniques employing metalloporphyrins appear suitable candidates for the development of spoilage indicators. Additional compounds that result in a stronger, better visible shift are currently being employed, as is the correlation between the measured volatile amines and the biogenic amines.

Key words: Food spoilage, volatile amines, biogenic amines, metalloporphyrins, colorimetric sensors.

PO3294

TRANSGENIC FOOD COMMERCIALIZATION IN SÃO PAULO CITY-BRAZIL

D. Moscatelli[1], A. Lucca[1], L B. Almeida[1], C S. Baldan[1], P H. Baldan-Pineda[1]

[1]Health Sciences Institute, Paulista University-UNIP, São Paulo, Brazil

Background and Objectives: Currently, transgenic crops create huge economic, social and ecological benefits with the development of its commercial production. The goal of the present work was to identify foods containing transgenic components in its composition, according to Brazilian food labeling regulation.

Methods: The seeking for transgenic foods was conducted in 6 supermarkets in São Paulo city, Brazil. The inclusion criteria were: (1) supermarkets presenting a great variety of foods, and (2) at least 1% of transgenic components in the food composition.

Results and Conclusions: It was found a total of 38 transgenic foods, comprising 20 different brands and 5 different kinds of transgenic foods, in all the six supermarkets. These 5 different kinds of transgenic foods included soybean oil (45%), corn starch (25%), powder for desserts (15%), corn meal (10%) and cornflakes (5%). Transgenic crops are increasing the global food production, but its consumption is still limited to soy and corn-derived foods through its commercialization in Brazil markets.

Key words: Transgenic food, food commercialization, food production.

PO3295

MANGOSTEEN PEEL (GARCINIA MANGOSTANA L.) EXTRACT FOR EFFERVESCENT TABLET

W. Widowati[1], D. Rusmana[1], D. Pujimulyani[2], H. Herdiman[1], H. Tiono[1], T. Liliana Wargasetia[1]

[1]Medical Research Center, Faculty of Medicine, Maranatha Christian University, Bandung, Indonesia
[2] Faculty of Food Technology, Mercu Buana University, Yakarta

Background and Objetive: Mangosteen peels are huge waste and unuseful material but have biological activity for human health. Preparing mangosteen peels with bitter taste require processing to produce the tasteful beverage, one of the processing is effervescence product. Effervescence has proved its utility as an oral delivery system in the pharmaceutical. This research was done to find out the best quality of effervescent tablet formula and to evaluate the antioxidant activities changes compared to mangosteen peel extract.

Methods: Efferfescence formula comprised sodium carbonate, citric acid, ascorbic acid, aerosil, aspartame, magnesium stearate and various concentrations of mangosteen peel extract. Six effervescent tablet formula and mangosteen peel extract were measured the 1,1-diphenyl-2-picryl-hydrazyl (DPPH) free radical scavenging activity, Superoxide Demutase (SOD) activity and total of phenolic compound using garcinone C, garcinone D, α-mangostin and γ-mangostin as standard.

Results: The DPPH scavenging activity and phenolic compound total of all effervescence product from mangosteen peel extract were lower compared to magosteen peel aqueous extract, but effervescence formula had SOD activity higher than magosteen peel aqueous extract. Based on the quality standard of effervescent tablet showed that six formula of mangosteen extract produced good effervescent tablet.

Conclusions: Mangosteen peel aqueous extract could be used as ingredient effervescent tablet. The DPPH scavenging acitivity and the phenolic compound of mangosteen peel effervescent tablet were lower than mangosteen peel extract, SOD activity of efferevescence were higher than mangosteen extract.

Key words: Antioxidant, effervescent tablet, Garcinia mangostana L, DPPH, SOD.

PO3296

CLASSIFICATION OF FOOD PRODUCTS ADVERTISED IN CHILEAN TELEVISION CHANNELS RELATED WITH THE NATIONAL ASSOCIATION OF TELEVISION DURING NOVEMBER 2010

M. Crovetto[1], S. Coñuecar[1], D. Flores[1], D. Maturana[1]

[1]Facultad de Ciencias de la Salud, Centro de Estudios Avanzados. Universidad de Playa Ancha, Valparaíso, Chile

Background and Objetives: Studies show that food advertising (PA) displayed in TV channels (TV) during child program action hours is mostly Unhealthy (NS). We aim to determine the nutritional content of Food Products Advertised (PAP) in Chilean TV channels associated with the National Association of Television (ANATEL) between Monday and Sunday from 8:00 to 22:00 during November 2010 to classify them according 'Nutritional Semaphore' according to their frequency and duration in programming.

Method: A qualitative and quantitative non-experimental descriptive transeccional with an oriented display, which corresponds to the PA issued on TV channels associated with ANATEL from Monday to Sunday from 8:00 to 22:00 hours between 7th and 28th November 2010, choosing randomly two weekdays, and Saturday and Sunday per each channel to analyze the frequency, duration, content of critical nutrients (Total Fat (GT), Saturated Fat (GS), simple carbohydrates (CHOs) and sodium), based on the labeling, and classification as ' Nutritional Semaphore' in Healthy (S), Moderately Healthy (MS) and NS, adding the PAP No Nutritional Information (SIN). The data was collected by structured observation within three participants and instruments were design previously.

Results: A total of 1916 ads, which accounted for 67.2% PAP NS, 15.4% S, 9.9% and 7.6% MS to SIN. Also analyzed 16 hours of PA, which were distributed as 66.3% PA NS, and S 17.7%, 9.8% and 6.2% as MS as SIN.

Conclusions: PA TV broadcast primarily shows Chilean food products high in NS GT, GS, and sodium CHOS, over 60% of the overall PA during the week and weekend, as well as in frequency and duration.

Key words: Food advertising, food, critical nutrients, obesity.

PO3411

ESSENTIAL AND HAZARDS: IS SUGARCANE (SACCHARUM OFFICINARUM) MORE THAN AN EMPTY-CALORIE COMMODITY?

A C. Avelar[1], F. Walter Motta[1]

[1]Department of Animal Sceinces, University Federal of Minas Gerais, Belo Horizonte, Brasil

Background and objectives: Sugarcane is one of the most important raw materials used in manufactured food products. Its consumption is under public scrutiny for decades, always associated to cavities, obesity and diabetes. Sugary beverage portion sizes have exploded as high as 64 fluid ounces in some fast food chains in the USA. Additionally, anthropogenic activities such the application of arsenic-based pesticides has resulted in elevated (high as 900 g.g-6) levels of arsenic (As) in surface soils in many historic sugar cane areas of Hawaii, USA. The goal of this study was to screening essential and toxic elements such As, Br, Ca, Na, some RREs, Rb, Sc and U in sugar cane from Minas Gerais, Brazil.

Methods: To quantify simultaneously many elements as possible, it was applied the well-established nuclear analytic technique of Neutron Activation Analysis at the IPR-R1 Reactor of CDTN/CNEN Brazil.

Results: The lack of essential elements in sugar cane is notorious: low concentration for calcium, one of the most important elements in man and animal lives, Ca = 84.8 ± 7.9 mg/100g in sugar cane. It was detect the presence of As, RREs, Rb, Sc and U in this product widely eaten, what is a matter for Public Health concern.

Conclusion: Besides the well documented risks associated to the high consumption of sugar, such as obesity and diabetes, high consumption of sugar can lead to ingestion of not negligible quantities of toxic elements such arsenic and uranium. Outcomes such the low content of calcium and the toxic elements detected raise questions about the appropriateness of the neutral term 'empty calories` what often is used to refer to sugar.

Acknowledgement: This project is supported by Brazilian agencies: CNPq and Fapemig.

Key words: Diabetes, obesity, sugarcane, toxic elements.

PO3412

INFLUENCE OF AGRICULTURAL BIODIVERSITY ON HOUSEHOLD FOOD SECURITY AND STUNTED GROWTH IN CHILDREN AGED 24-59 MONTHS IN RURAL KENYA

S. Ochola[1], M'K. Florence[2], N. Steyn[3], L. Du Plessis[2]

[1]Department of Food, Nutrition and Dietetics, Kenyatta University, Nairobi, Kenya
[2]Division of Human Nutrition, University of Stellenbosch, Cape Town, South Africa
[3]Human Sciences Research Council, Cape Town, South Africa

Background and objectives: Agricultural biodiversity has the potential to improve household food security and nutritional outcomes. In spite of this, there is limited scientific evidence in Sub-Saharan Africa linking Agricultural biodiversity with household food security and nutritional status of children hence the need for this study.

Methods: A cross-sectional analytical study was conducted in two rural resource-poor regions in Meru, Kenya. Interviews were conducted to collect data from 500 randomly selected households and anthropometric measurements taken for 500 children 24-59 months old. Agricultural biodiversity was measured by; the variety of food crops grown, animals domesticated for food and food items from natural habitats. Household food security was assessed by means of the household food insecurity access scale (HFIAS). A repeated 24-hour recall was used to collect data to assess individual dietary intake and dietary diversity (DD).

Results: Agricultural biodiversity was low with a total of only 26 food items consumed; 23 cultivated or domesticated and 3 from the natural habitat. Two food items from the natural habitat originated from plants and one from animals. A minority (15%) of the households were food secure. A majority (75%) of the households was food insecure with 50% being severely food insecure. Stunted growth among the children was high at 30.5%. Agricultural biodiversity was positively significantly related to: household food security (Spearman r = -0.10, p=0.022); dietary diversity (ANOVA, p<0.001) and stunted growth in children (ANOVA p<0.0001). Households with higher agricultural biodiversity were more likely to be food secure, have a higher dietary diversity and to have lower stunting levels among the children.

Conclusions: Agricultural biodiversity had a positive impact on household food security, dietary diversity and child growth. Interventions to improve child health in resource-poor rural households should aim at increasing dietary diversity through agricultural biodiversity.

Key words: Biodiversity, food security, Kenya, stunting.

PO3413

MONITORING THE BENZENE CONTENTS IN DIFFERENT FOOD MATRICES BY HEADSPACE-GC/MS

J H. Sung1, M J. Lee1, E Y. Kwon1, H J. Lee1, D G. Leem1, K R. Chae1, K S. Kwon1

[1]Center for Food & Drug Analysis, Busan Regional Korea Food and Drug Administration, Busan, Republic of Korea

Background and objectives: Benzene is one of the contaminants with the clearest evidence of carcinogenicity, and has been classified as carcinogenic to humans (Group 1) by the International Agency for Research on Cancer (IARC). People working in industry involved benzene might be exposure to high concentration of benzene. In the case of eating or drinking foods containing high levels of benzene, it can cause vomiting, irritation in the stomach, dizziness, sleepiness, convulsion and death (at very high levels). Benzene in several food is produced from the result of reaction between bezonate salt and ascorbic acid, or migrated from various packing materials, contamination of environment and water supply. Currently there are no legal limits worldwide for benzene in food products or beverages, thus the limit in drinking water is mostly used as a reference value. This reference value is limited to 10μg L-1 by the World Health Organization (WHO, 1996). The objective of this study was to determine the occurrence of benzene in foods of the Korean market and identify potential sources of this contaminant in foodstuffs.

Methods: A headspace gas chromatography/mass spectrometry method for the determination of benzene in various food matrices was developed and validated. The direct method for pre-treatment step was simple and fast compared with the distillation method. And each recovery rate of benzene was 95% and 90%, respectively.

Results: Consequently, the direct method was used to conduct a survey of various food matrices, vegetables, fruits, fat and oils and so on.

Conclusions: Our determined values contained either no detectable benzene or levels below the WHO's drinking water limit of 10 μg L-1.

Key words: Benzene, food, Headspace, GC/MS.

PO3414

PROTEIN ENRICHED ARTICHOKE MEAL WITH HIGH NUTRITIONAL AND FUNCTIONAL VALUE

M P. Carbonero Aguilar[1], M M. Díaz Herrero[1], J. Bautista Palomas[1], O. Cremades[2], L. Soares de Assunçäo[3]

[1]Departamento de Bioquímica y Biologia Molecular, Facultad de Farmacia, Universidad de Sevilla, Spain
[2]Escuela Universitaria de Osuna, Sevilla, Spain
[3]Universidad Federal de Viçosa, Brazil

Background and objectives: Nowadays is well accepted that a diet based in vegetable proteins is healthier than one based in animal proteins. Usually industrial protein concentrates are obtained by a wet procedure, protein extraction in alkaline solution and precipitation at its pI. This procedure leads to denaturalization of proteins and loss of functional properties, as well as to the reduction of other important products (polyphenols, vitamins, etc.). However, protein concentrates obtained by dry procedures (selective screening and elutration) allows obtaining products with 40-50% native proteins and all the others important compounds. In this work we present the characterization of protein enriched artichoke meal obtained from industrial sub-products of artichoke.

Methods: Artichoke sub-products were made into flour and fractionated by a dry procedure attaining four fractions: F-I, F-II, F-III and F-IV, which were analysed (humidity, ashes, proteins, carbohydrates, lipids, aminogram, solubility, water and oil retention.

Results: Artichoke flour (13.16%) has been concentrated by a dry procedure. Fractions F-III and F-IV present a protein concentration of 26.09% and 33.8%, respectively. F-IV amino acidic composition is well equilibrated (46.36 mg AEE/100 mg protein). This product can be used for the preparation of food products or formulas for young and old peoples. The content in AEE covers the FAO and OMS recommendations for preschoolers (32.0 mg AEE/ 100 mg protein) and adults (11.1 mg /100mg protein).

Conclusions: The main advantage of this product is that the proteins conserve their native conformations retaining, practically, all its functional properties, and it conserves also other functional products such as polyphenol, vitamins, fibre, ..., constituting a good sources for the preparation of food products or formulas for young and old peoples

Acknowledgements: This work was supported by funds from the Spanish Ministerio de Ciencia e Innovación and EU funds (FEDER) (IPT-2011-1418-060000).

Key words: Artichoke, protein, high nutritional value.

PO3415

PUBLIC PERCEPTION ON CLIMATE CHANGE AND ITS IMPACT ON FOOD SECURITY BASED ON EDUCATION ATTAINMENT AND GENDER IN BANGLADESH

M F A. Banna[1]

[1]Food Planning & Monitoring Unit, Ministry of Food, Government of Bangladesh, Bangladesh

Background and objectives: Climate change has become a major issue in recent times for Bangladesh. Bangladesh is an agriculture-based country and evidence shows that agriculture and food security can be affected by climate change. The aim of the study is to address the perception and attitude of climate change and its impact on food security among Bangladeshi urban people based on education attainment and gender.

Methods: A quantitative cross sectional study was conducted among 71 participants who were selected using snowballing method. Self-administered questionnaire was used to assess the outcome. The chi-square test was used to find association between categorical variables. Analysis to test for differences among education level was carried out using the Kruskal-Wallis analysis.

Results: Regarding understanding the definition of climate change, more respondents gave incorrect answers (56%) where as 75 % gave correct answer on food security. Education level was significantly associated with the definition of climate change(X^2=10.719, n=71, p=0.013) and food security (X^2=12.76, p=0.005). Almost all (96%) participant agreed that there is an adverse effect on climate change on food security. Over half (52%) of the participants thought that there will be a very high possibility that the future barriers against taking actions to mitigate climate change on food security will be financial factors followed by education and technology.

Conclusions: Participants with higher education level perceive better understanding of food security than those with lower education level. 'Increase temperature' is perceived by highest numbers of study population as climate change and its effect on food security.

Acknowledgements: I would like to express my sincerest gratitude to my respected supervisors Professor Cynthia Burek and Dr. Basma Ellahi during the submission of dissertation in 2009 in accordance with requirement of the University of Chester, UK.

Key words: Education attainment, gender, perception, climate change, food security.

[2]Food, Consumer Behaviour and Health Research Centre, University of Surrey, the United Kingdom of Great Britain and Northern Ireland
[3]International Agency for Research on Cancer, Lyon, France
[4]Institute of Food Research, Norwich, the United Kingdom of Great Britain and Northern Ireland
[5]Istituto Nazionale di Ricerca per gli Alimenti e la Nutrizione, Italy
[6]The NuGO-A Association, the Netherlands
[7]National Food Institute, Technical University of Denmark, Denmark
[8]National Institute for Public Health and the Environment, the Netherlands
[9]Université Claude Bernard Lyon 1, Lyon, France
[10]University of Paris 13, Paris, France

Background and objectives: Successful food and health research infrastructure is necessary to conduct high quality research and design effective public health strategies to improve population health through lifestyle, food and nutrition.

Objectives: EuroDISH will provide recommendations to stakeholders such as the European Strategy Forum on Research Infrastructures (ESFRI), the Joint Programming Initiative-Healthy Diet Healthy Life (JPI-HDHL) and future European funding programmes (e.g. Horizon 2020) on the needs and best-practice for food and health research infrastructures.

Methods and results: Research has been organised using the "DISH" model which represents four areas of food and health research: Determinants of dietary behaviour; Intake of foods and nutrients; Status and functional markers of nutritional health; Health and disease risks of foods and nutrients. The project consists of three phases: - Phase one (completed July 2013): Desk research, interviews (N=30) and stakeholder workshop conducted to map existing research infrastructure and identify gaps and needs. Initial findings suggested that research infrastructure was developed to different degrees across the four "DISH" research areas. - Phase two: Synthesis of research infrastructures and or different areas of research and explore the governance of research infrastructure. - Phase three: Feasible designs and roadmaps for the future development of research infrastructure.

Conclusions: The EuroDISH vision is to encourage the development of infrastructures that bring together resources and knowledge from different scientific fields. This will enable state-of-the-art, pioneering and innovative research to be conducted across Europe serving to provide a competitive advantage at a global level and tackle today's food related social, economic and health challenges.

Acnowledgements: EuroDISH is supported by the European Commission under the food, agriculture and fisheries and biotechnology theme of the 7th framework programme for research and technological development (grant agreement no. 311788)

Key words: Research infrastructure; Europe; EuroDISH; ESFRI; Nutrition.

CHILDHOOD DIETARY PATTERNS AND COGNITIVE FUNCTION

S. Edalati1, F. Bagherzadeh[1]

[1]Tabriz Medical University, Faculty of Nutrition, Tabriz, Iran

Background and objectives: Childhood is a time of rapid cognitive development and Nutrition can optimize brain cognitive capacity via different mechanism. Most of studies examining diet and cognitive function in children focus on specific micronutrient including Iron, Iodine, Zinc and Folate or different kinds of fatty acids such as EPA, DHA or ALA. However the pattern of food consumption may be of greater relevance too.Dietary pattern approach look beyond the single nutrient and therefore might better capture associations between diet and health outcomes.This review conducted to know dietary patterns identified related to cognitive function in childhood age.

Methods: Articles published in the PubMed database on this topic were searched and reviewed

Results: Studies showed that eating the recommended daily number of breads and cereals was associated with significantly higher IQ scores at 3.7 years.Ones who Eat fish at least weekly had signifantly higher IQ scores at 7 yearstoo.Consumption of margarine daily was associated with poorer cognitive functioning.In an other study,Higher scores on a discretionary pattern(characterized by biscuits,sweets,soda,crips and chocolate) were associated with 1-2 point lower IQ.

Conclusions: Association between overall diet and cognitive function early in life is less studied.As foods eaten together may be more important than any single ood or nutrient,Further research is needed to identify Dietary patterns associated with brain function in children.

02

PEDIATRIC OBESITY, A RISK FACTOR FOR IRON DEFICIENCY AND ITS COGNITIVE COMPLICATIONS: A NEED FOR DEVELOPMENT OF INTEGRAL NUTRITION PROGRAMS

S. Edalati[1], F. Bagherzadeh[1], S. Nabavi[1]

[1]Students' Research Committee, Faculty of Health & Nutrition, Tabriz University of Medical Sciences, Tabriz, Iran

Pediatric obesity, a risk factor for iron deficiency and its cognitive complications: A need for development of integral nutrition programs Edalati S;Bagherzadeh F;Nabavi S Students' Research Committee, Faculty of Health & Nutrition, Tabriz University of Medical Sciences, Tabriz, Iran

Background and Objectives: Childhood obesity is a major public health problem. In addition to increased risk of several complications, including metabolic syndrome or future cardiovascular diseases, obese children may be more prone to poor iron status that can affect long-term cognitive function. Different mechanisms explaining this relationship have been proposed. This review focuses on recent human studies that test hypotheses about the association between childhood obesity and anemia.

Materials and Methods: English articles published since 2000 and listed in PubMed were identified using defined key words and reviewed.

Results: Several studies found higher rates of iron deficiency in obese children and adolescents. Obesity may be associated with poor quality or restricted diets low in iron. Iron requirements in overweight individuals may be increased as well. In addition to poor dietary iron intake, the pro-inflammatory environment of adipose tissue appears to increase hepcidin concentrations and reduce iron absorption and availability in obese children compared to normal-weight children. Pediatric adiposity may also affect the response to iron fortification.

Conclusion: Co-occurrence of childhood obesity and anemia highlights the need to include obese or overweight children in screening programs for anemia. It is necessary to install integral nutrition education programs to address both of these common public health issues to prevent cognitive problems associated with anemia.

Key words: childhood obesity, hepcidin, iron deficiency

UNDER-NUTRITION LOWERS LEARNING AND MEMORY ABILITY AMONG CHILDREN AGE 5-6 YEARS OLD IN BOGOR – INDONESIA

E. Palupi[1,2], A. Sulaeman[2], A. Ploeger[1]

[1]Department of Organic Food Quality and Food Culture, University of Kassel, Germany

[2]Department of Community Nutrition, Bogor Agricultural University, Indonesia

Background: Insufficient nutrient intake during golden period (0-5 years) may influence brain development which is not possible to be paid-off on later life. Indonesian Ministry of Health reported that 17.9% Indonesian children have suffered of under-nutrition in 2010 (13% in West-Java). However, the current status needs to be identified to expand coverage.

Objectives: The objectives were to determine the current nutritional status of Indonesian children age 5-6 years old, to assess whether the nutritional status influenced their brain development, and to identify factors from their baby's history associated with their growth.

Methods: A survey base on cross-sectional study design was conducted to identify the nutritional status, brain development score (IQ, EQ, learning, and memory ability using Projective Multi-phase Orientation method), and some history of baby birth (birth method, birth weight, and exclusive breast-feeding) among 225 children age 5-6 years old from 7 different rural and urban areas in Bogor, West-Java, Indonesia, between November to December 2012.

Results: The prevalence of under-nutrition children age 5-6 years old in Bogor-Indonesia was 13.57%. Learning ability between under-nutrition- (N=30) and normal- children (N=179) were 44.13±29.43 and 46.98±27.03, respectively (P<0.05). Memory ability between severe acute malnutrition- (N=51) and normal- children (N=170) were 46.65±11.13 and 50.49±11.92, respectively (P<0.05). Emotional quotient (EQ) between children who did (N=111) and did not receive exclusive breast-feeding (N=110) were 374.28±46.35 and 367.51±35.88, respectively (P<0.05).

Conclusions: In Bogor-Indonesia, the current prevalence of under-nutrition children age 5-6 years is still high. This under-nutrition lowers their learning and memory ability. Children who received exclusive breast-feeding had a higher EQ score. Stronger efforts are needed to support the exclusive breast-feeding and nutritionally appropriate foods especially during their golden period to support their optimal growth. Acknowledgements: This study was supported by Faculty for the Future program from Schlumberger Foundation.

Key words: Under-nutrition, brain development, Indonesian children.

04

HABITUAL MISSING OF DINNER WAS ASSOCIATED WITH POOR NUTRITIONAL STATUS IN POOR-URBAN PRESCHOOL CHILDREN, LAGOS, NIGERIA

F. Uchendu[1], T. Atinmo[2], I. Akinyele[2], R. Sanusi[2], O. Oyewole[3], G. Fadupin[2], O. Adepoju[2], Folake. Samuel[2]

[1]National Open University Of Nigeria, Ibadan, Nigeria

[2]University of Ibadan, Ibadan, Nigeria

Background and objectives: Nutritional status is best global indicator of well-being in children. Effect of missing dinner on nutritional status of preschool children was studied.

Methods: A cross-sectional descriptive study was carried out in 304 preschool children in three poor-urban resource communities (Local Development Council Areas (LDCAs)) in Lagos, Nigeria. Anthropometric and demographic data of children were collected. Food questionnaire was distributed to 304 mothers asking them to state usual food intake of their children morning, afternoon and night. Data was analyzed using Statistical Package for Social Sciences (SPSS) 15.0 and National Centre for Health Statistics (NCHS)/WHO Anthropometric Standards, 2005.

Results: 5.6% of children habitually missed dinner. Mean height and weight of boys were 92.5±11.4cm and 14.7 ±2.2 kg and of girls were 91.8±2.3 and 14.9±2.3. 16.4% of the children were wasted, 41.4% were stunted and 6.6% were underweight. Wasting was prevalent in two out of three LDCAs (Oshodi 0.0%, Isolo 13.1%, and Ejigbo 38.5%) while Stunting was also prevalent in two out of three LDCAs (Oshodi 96.0%, Isolo 29.3%, and Ejigbo 0.0%), 0.05. Underweight was also significant with LDCAs (Oshodi 1.8%, Isolo 1.0%, and Ejigbo 17.7%), p<.05. Missing dinner and Locality were significant with wasting, stunting and underweight (0.05). Stunting alone was significant with missing dinner, locality, care giving, maternal and paternal education and occupation (0.05). Wasting and underweight but not stunting were highest in preschoolers who habitually missed dinner (0.05).

Conclusions: Missing dinner is a causative agent for poor nutritional status in preschool children in this study population.

Key words: Habitual missing dinner, Preschool children, Nutritional status, Local Community Development Areas (LCDAs)

05

THE RELATION BETWEEN DIET AND ALLERGEN CONCENTRATIONS IN BREAST MILK; OVALBUMIN CONCENTRATIONS AND LACTOFERRIN LEVELS IN BREAST MILK

M. Hara[1], N. Momose[2], S. Furukawa[2]

[1]Showa Women's University, Tokyo, Japan

[2]Jissen Women's University, Tokyo, Japan

Regardless of the consumption of the same amount of allergen-related foods, allergens were detected in some breast milk samples while not in the others. Breast milk is a secretory fluid. Therefore, concentrations of secretory fluid could potentially be linked with the concentration of allergens in the breast milk. Thus, the total protein and the levels of one particular protein, lactoferrin, in the breast milk were measured. The concentration of ovalbumin in breast milk was measured using an enzyme-linked immunosorbent assay (ELISA) kit, previously reported by us. The limit of ovalbumin level in breast milk is 312 ng/ml.The Lowry method was used for measuring the total protein. A Lactoferrin Human ELISA Kit was used to measure the lactoferrin levels. Therefore, we investigated cases wherein the level of ovalbumin was below or above 312 ng/ml. We found no significant difference when we compared the total protein level between breast milk with ovalbumin below 312ng/ml and that above 312 ng/ml. When we compared the lactoferrin level between breast milk with ovalbumin below 312ng/ml and that above 312ng/ml, a significant difference was observed. Consequently, if the ovalbumin level in breast milk is >312 ng/ml, the lactoferrin level is high, while if the ovalbumin level is <312 ng/ml, the lactoferrin level is low($P<0.01$). When evaluating the concentrations of ovalbumin in breast milk, the lactoferrin levels might be used as the point of reference.

06

ONTOGENY OF HYPOTHALAMIC EXPRESSION OF OBESITY RISK GENES REVEALS TIME SPECIFIC WINDOWS FOR FTO, MC4R AND GNPDA2

S. Sebert[1], M R. Jarvelin[1, 2, 3], M E. Symonds[4]

[1]Centre For Life Course Epidemiology, University Of Oulu, Finland

[2]Department of Children, Young People and Families National Institute for Health and Welfare, Helsinki, Finland

[3]Centre for Environment and Health, School of Public Health, Imperial College London, Norfolk Place, London W2 1PG, UK

[4]Academic Child Health, Early Life Nutrition Research Unit, University of Nottingham, UK

Background: There is increasing and robust evidence for a pluri-genic build-up of human obesity. A staggering number of very rare and common single mutations and structural variants have been found in association with adult BMI. This includes genetic polymorphism for genes strongly expressed in the hypothalamus which may play a role in the early development of energy balance and appetite control. However, very little is known about the ontogeny of these factors during early development.

Methods: We have collected fetal, early postnatal and adult sheep hypothalamus to analyse the possible time-specific expression of hypothalamic risk factors for human obesity. The real-time gene expression of FTO, MC4RM PCSK1, TMEM18, GNPDA2 and LEPR was measure at day -7, 0 (birth), 7, 30 and 365 days from entire hypothalamus.

Results: As expected we observed time dependant changes in gene expression (Paired-t-test) with early and late factors. For instance whilst MC4R and tmem18 showed peak of expression around the time of birth, fto only start peaking by 30 days of postnatal life.

Conclusion: Interestingly, the expressions of these key human obesity-genes are exhibited time dependent windows. In line with the fetal and life course origins of adult BMI, our present observations are suggestive of time windows for gene-environment interactions and corroborate the hypothesis for critical windows for early programming of obesity.

Key words: Hypothalamus, Energy balance, Obesity-related genes, Ontogeny

07

ASSOCIATION BETWEEN DIET AND MENTAL PERFORMANCE OF CHILDREN: VIEWS OF PARENTS AND TEACHERS IN FOUR EUROPEAN COUNTRIES

B. Egan[1], H. Gage[1], P. Williams[2], E. Györei[3], B. Brands[4], J C. López-Robles[5], C. Campoy[5], B. Koletzko[4], T. Desci[3], M. Raats[1]

[1]Food, Consumer Behaviour and Health Research Centre, University of Surrey, Guildford, Surrey, UK
[2]Department of Mathematics, University of Surrey, Guildford, Surrey, UK
[3]Department of Paediatrics, University of Pécs, Pécs, Hungary
[4]Dr von Hauner Children's Hospital, Ludwig-Maximilians University, Munich, Germany
[5]Department of Paediatrics, University of Granada, Granada, Spain

Background and Objectives: Nutrition is one of several factors affecting the mental performance of children; other possible influences include genetics, socio-economic background and educational environment. Although perceptions of the impact of diet on physical health is an important public health issue, little attention has been devoted to exploring views about the relationship between diet and children's mental performance. This issue was explored with parents and teachers of children of primary school age in four European countries.

Methods: An online questionnaire (developed in English and translated) was circulated through a market research organisation. Participants were selected from online panels if they were either a parent or teacher of child(ren) aged 4 – 10 years without learning or behavioural issues.

Results: Questionnaires were returned by 1606 parents (401 in England, Germany, Spain; 403 in Spain) and 403 teachers (100 in each country; 103 in Hungary). Teachers were older than parents (35.4% vs. 18.3% over 45years, p<.0005) and less likely to smoke (35.6% vs. 47.6%, p=.003). Diet was regarded as having a higher impact on physical development (overall health, energy, weight, physical activity, sleep) than mental (ability to learn, attention, memory, behaviour, mood) perfomance. Compared to parents, teachers thought that diet had a larger effect on behaviour, mood, attention and sleep. Sleep and teaching quality were viewed as more important determinants of attention and ability to learn than food-related items, of which having breakfast and regular meals were considered the most influential. There were few differences in views between countries.

Conclusions: Parents perceive diet as a less important influence on mental performance of primary school children than teachers in four European countries. This has implications for public health policy.

Key words: diet, mental development, teachers, parents

08

FACTORS AFFECTING FOOD CHOICES OF PARENTS OF CHILDREN AGED 4-10 YEARS IN FOUR EUROPEAN COUNTRIES

B. Egan[1], H. Gage[1], P. Williams[2], B. Brands[3], E. Györei[4], J C. López-Robles[5], B. Koletzko[3], C. Campoy[5], T. Desci[4], M. Raats[1]

[1]Food, Consumer Behaviour and Health, University of Surrey, Guildford, Surrey, UK
[2]Department of Mathematics, University of Surrey, Guildford, Surrey, UK
[3]Dr von Hauner Children's Hospital, Ludwig-maximilians University, Munich, Germany
[4]Department of Paediatrics, University of Pécs, Pécs, Hungary
[5]Department of Paediatrics, University of Granada, Granada, Spain

Background and Objectives: Children need a varied diet with good nutritional content for optimal physical and mental health and development. The factors affecting food choices of parents of children aged 4 – 10 years were explored in four European countries to assess the extent to which these were influenced by considerations relating to their impact on health and mental performance. Influences on decision making were investigated.

Methods: An online questionnaire (developed in English and translated) was circulated through a market research organisation. Participants were selected if they were a parent of child aged 4 – 10 years without learning or behavioural issues.

Results: Questionnaires were returned by 1606 parents (401 in England, Germany, Spain; 403 in Spain); 61.8% female. The most important factors affecting food choices were healthiness of the food (considered very much or extremely important by 83.3%), offering a variety of foods (80.0%), flavour of food (74.4%), effect on energy (67.4%). Of less importance was the effect of food on mental performance of the child (ability to learn, 52.5%; attention, 52.1%; mood, 50.4%; behaviour, 49.6%), and pragmatic factors (cost, 41.7%; ease of preparation, 35.3%). Over a quarter of respondents agreed that they did not know what foods affected their child's ability to learn (29.1%) or attention (26.4%); over 10% did not believe that food affected ability to learn (13.3%) and attention (13.3%). Common sense or experience was the most cited influence on food decisions (very much or extremely for 80.8%) with partners being second (52.2%).

Conclusions: Parents of primary school children in four European countries rely largely on their own experience to make food choices for their children and the impact of diet on mental performance is viewed as less important than food related factors. This has implications for public health policy.

Key words: food choice, parents, influence

09

ASSOCIATION BETWEEN DIET AND PHYSICAL AND MENTAL DEVELOPMENT OF CHILDREN: VIEWS OF PARENTS AND TEACHERS IN FOUR EUROPEAN COUNTRIES

H. Gage[1], B. Egan[1], P. Williams[2], J C. López-Robles[3], B. Brands[4], E. Györei[5], C. Campoy[3], T. Desci[5], B. Koletzko[4], M. Raats1

[2]Department of Mathematics, University Of Surrey, Guildford, Surrey, UK
[3]Department of Paediatrics, University of Granada, Granada, Spain
[4]Dr von Hauner Children's Hospital, Ludwig-Maximilians University, Munich, Germany
[5]Department of Paediatrics, University of Pécs, Pécs, Hungary

Background and Objectives: Although the impact of diet on physical health is an important public health issue, less attention has been devoted to the relationship between nutrition and children's mental performance. The views of parents and teachers about the extent to which diet affects physical and mental development of children of primary school age were explored and compared in four European countries.

Methods: An online questionnaire (developed in English and translated) was circulated through a market research organisation. Participants were selected if they were either a parent or teacher of child(ren) aged 4 – 10 years without learning or behavioural issues.

Results: Questionnaires were returned by 1606 parents (401 in England, Germany, Spain; 403 in Spain) and 403 teachers (100 in each country; 103 in Hungary). Teachers were older than parents (35.4% vs. 18.3% over 45years, p<.0005) and less likely to smoke (35.6% vs. 47.6%, p=.003). There was no difference between the proportions of parents and teachers thinking that a child's physical development depended very much or extremely (vs. moderately, slightly, not at all) on diet (overall 79.8%). Lower proportions of both groups thought mental development was very much/extremely influenced by diet (67.4%). In regression modelling, believing that physical and mental performance was very much / extremely influenced by diet was significantly and positively associated with living in Hungary, scoring more highly on a measure of general health interest and (parents only) level of education attained.

Conclusions: Diet is regarded as a less important determinant of mental development than physical development by parents and teachers of primary school children in four European countries. Parents who had received less formal education are less likely to view diet as a factor in mental or physical development. This has implications for public health policy.

Key words: Diet, development, parents, teachers

MILD IODINE DEFICIENCY IN PREGNANCY IN EUROPE AND ITS CONSEQUENCES FOR COGNITIVE AND PSYCHOMOTOR DEVELOPMENT OF CHILDREN: A REVIEW

C. Trumpff[1, 2], J. de Schepper[3], J. Tafforeau[1], H. Van Oyen[1], J. Vanderfaeillie[4], S. Vandevijvere[1]

[1]Institut Scientifique de Santé Publique, Brussels, Belgium
[2]Faculté des Sciences Psychologiques et de l'Education, Brussels, Belgium
[3]Departement of Paediatric Endocrinology, UZ Brussel, Brussels, Belgium
[4]Faculty of Psychology and Educational Sciences, Vrije Universiteit Brussel, Brussels, Belgium

Background and objectives : Several European countries are still suffering from mild iodine deficiency (MID), despite the introduction of salt iodization programmes at national levels. Pregnant women are the most prone to iodine deficiency, due to their increased physiological needs of iodine. MID during pregnancy may affect the neurodevelopment of the foetus. This paper therefore aims to assess the importance of iodine intake during pregnancy by reviewing European studies about the impact of MID during pregnancy on neurodevelopment of children.

Methods: Studies about the cognitive or psychomotor outcomes of European children exposed to MID during pregnancy and studies about iodine or thyroid hormone supplementation were reviewed. 17 European studies were reviewed.

Results: MID during pregnancy may lead to hypothyroxinaemia in the mother and/or elevated thyroid-stimulating hormone levels in the foetus. Hypothyroxinaemia during pregnancy may affect cognitive development of children when appearing before or at 12 weeks of pregnancy. Moderate cognitive impairments have been observed in children from the age of 3 weeks up to 5 years. Elevated thyroid-stimulating hormone levels in the newborn showed to be related with intellectual or psychomotor delay in early childhood. However, no direct link is yet established between MID during pregnancy and maternal hypothyroxinaemia, as well as between MID during pregnancy and elevated neonatal thyroid-stimulating hormone levels at birth. To end, iodine supplementation of pregnant women when taking place from the first trimester until the end of pregnancy may decrease the risk of developmental delay in the offspring.

Conclusions: There is some evidence that MID appearing during pregnancy may adversely affect cognitive and psychomotor development of the offspring. Iodine supplementation during pregnancy may be beneficial to avoid the risk of developmental delay.

11

THE EFFECTS OF BREAKFAST ON IN-CLASS BEHAVIOUR IN CHILDREN AND ADOLESCENTS

K. Adolphus[1], C. Lawton[1], L. Dye[1]

[1]Institute Of Psychological Sciences, University Of Leeds, West Yorkshire, UK

Background and objectives: Assumptions regarding the benefits of consuming breakfast for children's learning are largely based on evidence investigating the effects of breakfast on cognitive performance. There is some additional evidence that breakfast consumption, can improve school performance. Studies rarely investigate the effects of breakfast on in-class behaviour despite the clear importance of good behaviour for learning and academic outcomes. Hence our aim was to review existing literature on the effect of breakfast consumption on behaviour in children.

Methods: A comprehensive review of the literature was conducted for original articles and reviews published between 1950-2013. The review identified nineteen studies that examined the effects of breakfast on behaviour in children and adolescents, either by use of classroom observations or teacher completed rating scales.

Results: The evidence indicates a largely positive effect of breakfast on on-task behaviour in the classroom in children aged 6-18 years which is more apparent in children who are undernourished and/or from low socio-economic or deprived backgrounds. Findings for other behavioural outcomes including off- task behaviour, distraction and hyperactivity are inconsistent and often null findings are reported.. Evidence is also limited by the inherent subjective nature of the behavioural assessment and heterogeneity in study designs.

Conclusions: Whilst crude subjective measures of behaviour may not provide the most sensitive indicators of the benefits of breakfast, these outcomes are ecologically valid, and of relevance to pupils, parents, teachers and educational policy makers and, as a result, may produce greatest impact.

Key words: Breakfast, adolescents, in-class behaviour

12

POLYUNSATURATED FATTY ACID LEVELS IN BLOOD DURING PREGNANCY, AT BIRTH AND AT 7 YEARS: THEIR ASSOCIATIONS WITH DIET AND TWO COMMON FADS2 POLYMORPHISMS

P. Emmett[1], E. Reischl[2], L. Johnson[1], C. Steer[1]

1University Of Bristol, Bristol, UK
[2]Helmholtz Zentrum München, Oberschleißheim, Germany

Long-chain polyunsaturated fatty acids (LCPUFA such as DHA and EPA) are essential to brain development and are especially important during pregnancy. They can be synthesised in the body by a metabolic pathway involving fatty acid desaturase genes (FADS) but are also supplied by the diet. The balance between these two sources in a population-based cohort will be investigated. In a UK cohort of pregnant women and their offspring at birth and aged 7y levels of fatty acids (FA) in pregnancy blood samples, in cord blood and at 7y have been measured. DNA was extracted and FADS genotype obtained for mother and child. Diet was assessed at 32 weeks of pregnancy and at 7y by food frequency questionnaire. Energy, nutrient and food group intakes were calculated. Reduced rank regression (RRR) will be used to assess the contribution of different foods to blood FA levels in childhood. We have shown that FADS genotype in the mother modifies individual LCPUFA levels in the blood in pregnancy and at birth. FADS genotype in the child, contrary to expectation, also modifies LCPUFA levels at birth. By 7y, only the child's genotype was independently associated. Oily fish has the strongest association with DHA at all ages with white fish also contributing to cord and 7y levels and shellfish to 7y levels. All three seafood types contributed to EPA levels at all time points in unadjusted analyses. We will present data investigating how linear combinations of FAs can be estimated to maximise the correlation with diet. We will explore whether these linear combinations provide more useful indicators of FA status than individual FAs and how diet and FADS variants contribute to these indicators. We know that fish eating is important for LCPUFA levels in pregnancy. We will provide evidence based advice regarding childhood diet.

13

PREVALENCE OF DELAYED GROWTH IN SCHOOL CHILDREN BETWEEN 5 TO 10 YEARS OF AGE OF DISTRICT EDUCATIONAL INSTITUTION IN BOGOTÁ, COLOMBIA

L. Ladino[1], C N. Sepulveda[1], C A. Velasco[2]

[1]Universidad Javeriana, Bogotá, Colombia
[2]Universidad del Valle, Valle del Cauca, Colombia

Objectives and Study: Delayed growth (DG) is a result of several processes that prevent adequate longitudinal growth in children. Among the causes of this DG, are acute malnutrition processes that occur during prolonged periods of time, changes in the first peak of growth that conditioning a DG throughout life as longitudinal gain can not easily meet as weight gain. The objective is to identify the DG in school children between 5 and 10 years of District Educational Institution in Bogotá, Colombia.

Methods: We included 432 school children between 5 and 10 years, students at an educational institution in Bogotá, Colombia. Anthropometric nutritional assessment was performed. Were classified according to WHO and their respective cutoffs for height/age, as with the cutoff points for Colombia to have a standard deviation less, and is called risk of stunting.

Results: 432 children with 7 years 7 months ± 1 year 3 months (range 5 to 9 years 11 months) of age, which the WHO cutoffs and Colombia, 22 had DG (5.1%): 21 with short stature and predominantly female and one child with severe stunting. According cutoffs for Colombia, 103 were classified at risk of stunting (23.8%) with a predominance of females (52.4%).

Conclusion: The prevalence of DG was 5.1%, predominantly female, being < 9.0% as reported by the Encuesta Nacional de la Situación Nutrcional (ENSIN) in Colombia 2010 and the prevalence of risk of stunting of 23.8% also < of the reported by ENSIN 2010 which was 30.1% for children between 5 and 17 years of age.

14

DOES MATERNAL IODINE STATUS IN UK PREGNANT WOMEN INFLUENCE CHILD NEURODEVELOPMENT?

S C. Bath[1], C D. Steer[2], P M. Emmett[2], J. Golding[2], M P. Rayman[1]

[1]Department of Health and Medical Sciences, Faculty of Health and Medical Sciences, University of Surrey, Guildford, UK
[2]School of Social and Community Medicine, University of Bristol, Oakfield House, Bristol, UK

Background and Objectives: An adequate intake of iodine is vital during pregnancy as iodine is required for fetal brain development. The UK is now classified as mildly iodine deficient and has no national policy for ensuring adequate iodine status, such as salt iodisation. We aimed to investigate whether a low iodine status in pregnancy was associated with adverse child neurodevelopment.

Methods: We measured maternal iodine status in pregnant women of the Avon Longitudinal Study of Parents and Children (ALSPAC) cohort who were recruited in the 1990s(3). We measured iodine concentration (and creatinine to adjust for urine volume) in spot-urine samples collected from 1475 women throughout pregnancy. We analysed 1142, 557 and 356 urine samples from the first, second and third trimesters of pregnancy respectively.

Results: We have previously shown that a low iodine status during the first trimester is adversely associated with child cognition (verbal IQ and reading ability) up to the age of nine years (Bath et al 2013, Lancet). Urinary iodine-to-creatinine ratio significantly differed between trimesters in women with measures in all three trimesters (n=227, p<0.0001), with iodine-to-creatinine ratio being significantly lower in the first than trimesters two and three (p<0.0001). After adjustment for 21 confounders, a low iodine-to-creatinine ratio in the second trimester (<150 μg/g) was significantly associated with risk of performance IQ score below 85 (OR 1.79, 95% CI 1.03-3.12); there was no association between iodine status in the third trimester and child IQ, although this may reflect the lower number of samples. **Conclusions:** Iodine deficiency during pregnancy is associated with adverse child cognition, even in a country where iodine deficiency is only mild. We are involved with ongoing work with Generation R to compare our results with those of a country classified as iodine-sufficient (the Netherlands).

Key words: Iodine, UK, pregnancy, neurodevelopment.

[5]Department of Legal Medicine, University of Granada, Granada, Spain
[6]Department of Clinical Psychology and Personality treatment, University of Granada, Granada, Spain
[7]Department of Paediatrics, University of Granada, Granada, Spain

The aim was to determine the influence of mothers' Pro12Ala PPARγ2 gene polymorphisms on their offspring neurodevelopment at 18 months of life. From the 474 pregnant women recruited in the PREOBE study, 138 mother-infant pairs were included in the present analysis. Mothers and infants were genotyped for Pro12Ala PPARγ2 (Applied Biosystems, Foster City, CA-USA). Neuropsychological assessment was performed using Bayley Scales of Infant and Toddlers Development, Third Edition (Bayley III). Pre-conceptional BMI, mother's age, diabetic condition, parity, smoking, alcohol drinking during pregnancy, placental weight, neonatal anthropometry, sex, Apgar 5' and type of feeding during early life were considered as a confounders. SPSS version 20.0 was used for statistical analysis. 118 women (85.5%) had major CC genotype and 20 women (14.5%) showed the heterozygous genotype of CG. No homozygosis was found in the mothers' group. Babies born to mothers with CG Pro12Ala PPAR γ2 polymorphism had higher birth weight (p=0.036). At 6 months of age, no differences in neurodevelopment were observed between babies born to CC or CG mothers. At 18 months, in the cognitive domain, both the composite and the scaled scores were significantly lower in the offspring of CG mothers (p=0.006). Furthermore, logistic regression analysis demonstrated that CG mothers have 13% of risk to have babies with lower cognitive development at18 months (IC: 0.028-0.606). Scaled Receptive Communication, Scaled Fine Motor and Motor Composite scores resulted significantly lower (p=0.020, p=0.042, p=0.013, respectively) in those babies born to CG mothers at 18 months of age. The present study suggests that Mothers' PPARγ rs1801282 CG polymorphism plays a negative role on their offspring neurodevelopment scores at 18 months. Key words: PPARγ2, neurodevelopment, obesity, early programming **This study was granted by Junta de Andalucía: Excellence Projects (P06-CTS-02341) and Abbott Laboratories-General Foundation University of Granada (Contract agreement: 3346)

IRON DEFICIENCY AND SCHOOLCHILDREN COGNITIVE PERFORMANCE IN MOROCCO

Y. Aboussaleh[1], M. El Hioui[1], I. Achouri[1], H. El Marzouki[1], A. Ahami[1]

[1]Ibn Tofail University, Kenitra, Morocco

Background and objectives: Iron deficiency is the most prevalent nutritional disorder in the world. One of the most worrying consequences of iron deficiency in children is the alteration of behaviour and cognitive performance. This study aim to study cognitive performance of schoolchildren in kenitra, Morocco

Methods: All the 296 pupils enrolled in a primary school and aged between 6 and 16 years old were recruited for this study with parental clearance approved.Socio demographic data were collected with questionnaire filled out by the parents. Intellectual Ability was assessed by Raven's Progressive Matrices (Raven, 1958). Blood was collected by antecubital venipuncture .Haemoglobin (Hb), haematocrit (Hct) and mean corpuscular volume (MCV) and Serric Ferritin were masured or calculated.

Results: The average age was 10.2 ± 2.48 years and the mean haemoglobin concentration was 12.41 g/dl in boys and 12. 5 g/dl in girls, whereas the mean ferritin level was 26.7 µg/l and 27.9 µg/l respectively. In this study 12% of schoolchildren have anaemia. Anaemia is predominantly moderate and affects of boys more than girls. Iron deficiency was found in 20.4 % of the children and of iron-deficiency anaemia in 7.7 %. A positive correlation between serum ferritin and both the score in Maths (R = 0.5) and the average annual school score (R = 0.37). Raven Progressive score is correlated to serum iron and school performance (p <0.001)

Conclusions: We found a correlation between the score test matrices progressive Raven and school performance expressed by the global annual rank . We also note a positive correlation between the rate of ferritin and the note of mathematics. Further studies are needed to clarify the physiological and biochemical bounds related to theses statistical associations.

Key words: Iron deficiency, anemia, schoolchildren, Morocco

RECOMMENDATION PROVIDED BY HEALTH PROFESSIONAL TO PERSON WITH TYPE 2 DIABETES REGARDING PHYSICAL ACTIVITY IN WEST AFRICA

F. Garanet[1], S. Besançon[2], C. Mesenge[1], H. Delisle[3]

[1]Health Department, Senghor University, Alexandria, Egypt
[2]ONG santé Diabete, Mali
[3]Department of Nutrition, University of Montreal, Montreal, Canada

Objectives: To assess the recommendations provided by health professionals to persons with diabetes regarding physical activity. Methodology: The cross-sectional study was conducted over three months in 2012 in Ouagadougou (Burkina Faso) and Bamako (Mali). Interviews with closed and open-ended questions were conducted with a total of 78 health professionals (including 60 MDs) involved in the treatment of persons with diabetes in public hospitals and health centers.

Results: 77% of health professionals interviewed were physicians For physical activity 95% of the health professionals had a satisfactory recommendation and the factors associated were the country, the occupied station and the received formation. The different physical activity recommended by the health professional was walk, bicycle, house work and jogging. Indeed, the doctors recognize the difficulties related to the practice of sport in the African cities. About the physical activity, for the totality of the health professional, the answer most shared by all and stated is "In the African context, the practice of the sport in the city is almost non-existent. Even the Town hall does not take into account space for the sport. Thus one asks the patients to do themselves, the households, the detergent, to walk to go to work. It is really all that one can do".

Conclusion: The study highlights the need to improve dietary counseling of patients with diabetes, particularly as regards developing specific dietary plans with individual patients for better compliance. Health professionals specialized in nutrition are becoming a priority in Africa to address nutrition-related non-communicable diseases, to train other health professionals and to assist individual patients.

LOW HOUSEHOLD DIETARY DIVERSITY IS A MAJOR PUBLIC HEALTH CONCERN FOR WOMEN IN COASTAL BANGLADESH

Md Z. Islam[1], A. Hossain[1], E. Hasib[1], N. Awan[1], S F. Rashid[1]

[1]BRAC UNiversity, Dhaka, Bangladesh

Background and objectives: Research indicated that dietary diversity is a good indicator of food security at household level. Women of reproductive age living in resource-poor setting are at risk of micronutrient deficiency. Present study was designed to evaluate the household dietary diversity and individual diversity for women in 3-impoverished districts (Satkhira, Khulna and Barisal) of southwest coastal Bangladesh (a part of Ganges Delta).

Methods: A total of 1536 households were selected to determine household dietary diversity score (HDDS). One woman (aged 15-49 yrs) per household was selected to ascertain the individual dietary diversity score (IDDS). A cluster sampling design was used and in each cluster, 24 households were selected systematically for interview and anthropometric measurements. Information on food intake was collected for 7-days. Food consumed during 7-days was condensed into 9 food groups. The range of possible HDDS was 0-63. The IDDS was assessed on 12 food groups consumed during last 24-hrs and score ranging 0-12. Other relevant data were also collected.

Results: The overall mean HDDS was very low (mean, SE; 32.4, 0.22). We found households in the district of Khulna most vulnerable ($P<0.0001$) compared with other 2-districts. The overall mean IDDS of women was also predominantly low and significantly lower ($P<0.0001$) in the District of Khulna compared with other 2-districts. Low BMI values (BMI <18.5 kg/m2) were highly prevalent (22%) in women. Physical characteristics such as height, weight, MUAC and BMI were not significantly different in three districts.

Conclusions: The results of the study indicated that households in Khulna district might be the most vulnerable to food insecurity and women in this area may be at risk of micronutrients deficiency due to low dietary diversity. Urgent integrated agriculture interventions are warranted for improved food and nutrition security in this region.

Key words: Dietary diversity; Food insecurity; Women; Bangladesh

19

MATERNAL LCPUFA SUPPLEMENTATION DURING PROTEIN DEFICIENCY IMPROVES BRAIN FATTY ACID ACCRETION IN RAT PUPS BY ALTERING MILK LCPUFA OF DAM

P. Ranade[1], S. Rao[1]

[1]Biometry and Nutrition unit, Animal Sciences Division, Agharkar Research Institute, Pune, India

Background: Long-chain PUFA (LCPUFA) are important for fetal and neonatal brain development. However, their accretion in the brain is compromised during maternal protein restriction.

Objectives: We investigated the effect of maternal supplementation with n-3 DHA plus n-6 arachidonic acid (ARA) at a low protein level (9 %) on offspring brain fatty acid accretion using Wistar rats.

Methods: Nine female rats per group were randomly fed control (C-18%), low-protein (LP-9%) or low-protein DHA + ARA-supplemented (LPS) diet during gestation and lactation, to assess effects on brain LCPUFA composition of pups.

Results: At birth, pups from LPS group had highest brain DHA and n-3 fatty acid levels(P = 0.001), whereas pups from LP group had highest MUFA (P = 0.05) but lowest DHA and total n-3 PUFA levels (P = 0.000). During lactation, pups from LPS group accrued significantly more α-linolenic acid (P = 0.003), EPA (P = 0.02) and DHA (P = 0.000) in brain lipids than pups from LP group, whereas brain lipids of pups from LP group had markedly increased levels of the n-3 deficiency marker docosapentaenoic acid and n-6:n-3 ratio (P = 0.000). Owing to supplementation, milk from LPS dams had highest DHA and ARA, but lower SCFA and medium-chain fatty acids as compared with milk from C and LP dams during early lactation, which normalized by mid-lactation.

Conclusions: Adverse effects of restricted maternal protein intake on LCPUFA accretion in the brain of offspring were ameliorated by alterations in maternal milk fatty acid profile due to supplementation. Results underscore the importance of LCPUFA for protein-deficient mothers during gestation as well as lactation to achieve the optimum brain LCPUFA status of progeny.

Key words: LCPUFA, Maternal supplementation, Protein restriction, Brain lipids, Milk lipids

20

PHYSICAL ACTIVITY, SEDENTARY BEHAVIOUR AND FOOD HABITS, OF OVERWEIGHT STUDENTS BETWEEN 5 AND 10 YEARS OF A SCHOOL IN BOGOTÁ, COLOMBIA

C. Sepulveda[1], L. Ladino[1]

[1]Nutrition and Biochemistry Department, Pontificia Universidad Javeriana, Bogota, Colombia

Childhood obesity is a problem of the 21st century according to the World Health Organization. The ENSIN 2010 reported overweight in 18.9% of children between 5 and 9 years. **Objective:** Describe physical activity, sedentary behavior and dietary habits, of overweight school children between 5 and 10 years of a school in Bogota, Colombia.

Methods: Anthropometric nutritional assessment (H/Y and BMI/Y) with WHO growth standards 2006 - 2007, Resolution 2121 and WHO cutoffs, fat percentage, physical activity measured by pedometer, sedentary activities and habits assessed by survey, energy intake evaluated by food 3 days record, data analysis using descriptive statistics with Microsoft Excel 2011 for Mac and Epi info 7.

Results: Age 8 years 5 months ± 1 year and 3 months, 53.8% male, 41.8% obese schoolchildren by IMC, 80.8% obese according body fat, 7462±3028 steps/day, sedentary students (57.8%), sedentary activities 2-4 hours/day (52.6%), energy 1842±464 kcal/day, caloric distribution: protein (15±1%), fat (30±4%) and carbohydrates (56±4%), excess energy (42.1%).

Conclusion: Students with excess weight, cardiovascular risk, low physical and sedentary activities, sedentary activities more than two hours and energy intake increased but suitable total caloric value.

Key Words: Childhood, Obesity, Physical activity, Sedentary lifestyle, Energy Intake.

21

ASSESSMENT OF ENERGY EXPENDITURE AND IRON STATUS OF PREGNANT WOMEN IN URBAN AND RURAL COMMUNITIES IN NIGERIA

I. Onimawo[1], V. Onuorah[2]

[1]Ambrose Alli University, Ekpoma, Nigeria

[2]Michael Okpara University of Agriculture, Umuahia, Nigeria

Objective: The study was carried out to evaluate the energy expenditure and iron status of 400 pregnant women in their various trimesters from two hospitals (urban and rural) in Umuahia in Abia State.

Methods: The subjects were randomly selected. Anthropometric measurements, haemoglobin level, Packed Cell Volume, Serum Ferritin level, energy intake and energy expenditure assessment were carried out on the study population using standard procedures.

Results: Results of the analysis showed that the mean BMI of the mothers - the first, second and third trimesters were 25.25 ± 3.81, 26.24 ± 3.37 and 30.64±17.61kg respectively. Arm circumference values ranged between 9.74, 9.85 to 11.15cm in the third trimester. Abdominal circumference ranged 48.24 ± 10.56 - 49.26± 10.61. The result further showed that 19%, 12.8% and 0.5% had mild, moderate and severe anaemia respectively. A total of 40% of the pregnant women in the rural areas had various forms of anaemia as against 24.5% in the urban areas. A total of 32.2% of the pregnant women had iron deficiency anaemia. The prevalence of iron deficiency anaemia was also significantly associated with the trimesters (X2 = 22.58, P = 0.00).

Conclusion: The study found that the pregnant women had a positive energy balance. About 12% and 14% of the women in their second and third trimester respectively had protein intake above the recommended intake. A total of 40.0% of rural women were anaemic.

22

DOES MATERNAL POSTPARTUM DEPRESSION HAVE LONG-TERM EFFECTS ON CHILD'S BEHAVIOUR?

M. Gispert-Llaurado[1], V. Luque[1], M. Cardona[1], M. Zaragoza-Jordana[1], J. Canals[1], J. Escribano[1], N. Ferré[1], A. Blanco[1], M. Weber[2], V. Grote[2], B. Koletzko[2], G. Haile[2], D. Gruszfeld[3], K. Szott[3], E. Verduci[4], A. Re Dionigi[4], A. Xhonneux[5], F. Martin[5], C. Rubio-Torrents[1], R. Closa-Monasterolo[1]

[1]Pediatrics Unit, Universitat Rovira i Virgili, Reus, Spain
[2]Children's University Hospital, University of Munich Medical Centre, Munich, Germany
[3]Children's Memorial Health Institute, Warsaw, Poland
[4]University of Milan, Milan, Italy
[5]CHC St Vincent Liege, Liege, Belgium

Background and objectives: Previous studies reported that children born to mothers who suffered postpartum depression (PPD) could have increased conduct problems later in childhood. The aim of our study is to assess the relation between child's emotional and behavioural problems at 8 years with mother's PPD considering current maternal health problems (CMP).

Methods: This study uses data from EU-Childhood Obesity Project (NCT 00338689). Mothers completed the Edinburgh Postnatal Depression Scale (EPDS) 3 months after delivery, and once children reached the age of 8y they filled in the Child's Behaviour Checklist (CBCL) (Internalizing (IP), externalizing (EP) and total problems (TP)) and the General Health Questionnaire (GHQ-12) to assess CMP. EPDS scores >10 were defined as PPD and GHQ-12 hits >2 were defined as CMP.

Results: Four-hundred seventy-four mothers filled in a full set of EPDS, GHQ-12 and CBCL tests. Children whose mothers had PPD and CMP (n=50, 11.21%) showed higher TP, IP and EP than those whose mothers only had PPD ($p<0.001$, $p=0.001$ and $p=0.001$, respectively). Children whose mothers only had CMP showed increased TP and IP scores than those whose mothers didn't have any alteration ($p<0.001$, for both cases), while those who only had PPD didn't differ in CBCL results from those without maternal problems at any timepoint. Linear regression models adjusted by gender, maternal education and child's birth weight showed significant effect of EPDS and GHQ-12 on TP (B=0.495, $p=0.004$; B=1.349, $p<0.001$, respectively; r2=15.4%), IP (B=0.127, $p=0.035$; B=0.513, $p<0.001$, respectively; r2=8.5%) and EP (B=0.168, $p=0.012$; B=0.411, $p<0.001$, respectively; r2=12.5%).

Conclusions: PPD and CMP have effect on child's behaviour problems at 8 years. Children whose mothers suffered PPD and CMP were those with the highest problems level. CMP had stronger effect than PPD on child's behaviour problems at 8 years.

Key words: children behaviour problems, postpartum depression, Nutrimenthe, early programming.

EFFECTIVNESS STUDY OF THE CONSUMPTION OF MILK FORTIFIED WITH IRON ON THE NUTRITIONAL STATUS OF SCHOOL CHILDREN IN MOROCCO

I. El Menchawy[1], E. Aglago[1], M. Azlaf[1], B. Rabi[1], H. Belghiti[2], M. El Gour[1], K. El Kari[1], A. El Hamdouchi[1], A. Achour[3], E. Rjimati[4]

[1]UMRNA, URAC 39, Faculty Of Sciences, University Ibn Tofail-CNESTEN, Rabat, Morocco
[2]Military Hospital Mohamed V, Rabat, Morocco
[3]Centrale Laitière Foundation, Rabat, Morocco
[4]Ministry of Health, Rabat, Morocco

Iron deficiency anemia is a major national health problem. It can negatively affect growth, motor and cognitive developement, immunity and academic performance of school children. This is a longitudinal, randomized, double blinded study aiming at the evaluation of the effectivness of consumption of iron fortified milk on the iron status of school children in the

rural region of Azilal. The students (n = 361), 7-9 y old, were recruted from 3 schools. The nutritional intervention lasted 9 months. One group of the students received daily 200ml of non-fortified milk (NFG), the other group(FG) received daily 200ml of iron fortified milk (2,1mg of ferrous sulfate). In field, a clinical assessment, morbidity survey, blood samples collection and cognitive tests were performed at T0 – T5 and T9. Ferritine level was determined by immunoassay Elisa test, CRP by nephelometry and Hb concentration by Hemocue analyser. Raven progressive matrix was used for the cognitive test and SPSS for statistical analysis of data. The results showed that the prevalence of anemia (Hb<11,5g/dl), after adjustment for altitude, for the FG was 2,6% at baseline and 0% at T9. For the NFG, it was 3,4% at baseline and 1,8% at T9. Iron deficiency (serum ferritine<12µg/L) for the FG was 34,7% at baseline and only 25% at T9. For the NFG, the prevalence at baseline was 43,9% and 45,7% at T9. As the study has just ended, the interpretation of the results of cognitive tests is still ongoing. The milk is a good vehicle for fortification ; its consumption reduced the prevalence of iron deficiency by 28% in school children of the region of Azilal living in normal conditions and without preliminary deworming. This study was performed with the support of Fondation Centrale Laitière.

Key words: iron deficiency – school children – fortification - iron

CONTRIBUTION OF LOCAL FOOD BIODIVERSITY TO DIET AND NUTRITION OF WOMEN OF CHILDBEARING AGE IN BENIN

C E. Mitchikpe[1], Q I. Nonfon[1], G D. Ntandou-Bouzitou[2]

[1]Faculty Of Agricultural Sciences, University Of Abomey-Calavi, Cotonou, Benin
[2]Programme Nutrition et promotion de la Diversité, Bioversity-Benin, C/O IITA Benin, Cotonou, Benin

Background and objectives: Urbanisation and integration to market affect traditional food (TF) production, marketing and consumption systems, leading to increasing utilisation of manufactured foods of poor nutritional quality. Consumption of such foods may be associated with chronic diseases and nutritional deficiencies. Objective of this study was to assess the relation between market integration and the contribution of TF to diet and nutrition of women of childbearing age.

Methods: 472 women were selected in 34 villages in three communes using multistage random sampling. Households were classified according to market categories attended (rural, semi-urban and urban) and market accessibility (time to reach the nearest by car: high, middle, and low accessibility). Foods consumed by subjects were measured using observed weighed records method on two non-consecutive days. Body Mass Index was calculated using anthropometry.

Results: About 100 TF were identified and classified in 13 food groups. Average food diversity score was significantly higher for households attending urban market but was not significantly different between market accessibility groups. About 100% of subjects consumed traditional cereals, spices and condiments, and more than 78% consumed vegetables, legumes, oils, fish, roots and tubers in various form. Consumption of food groups varied according to market categories and market accessibility. Maize was the main cereal consumed with no significant difference between market categories or market accessibility. TF contribution to total daily energy and nutrient intakes was between 76.7 and 98.4%. Iron, magnesium, zinc, thiamine and vitamin A needs were covered by TF only. Nutritional status of women was not significantly different between groups.

Conclusions: The contribution of TF to diet and nutrient intakes of women of childbearing age in study area was high regardless of market integration.

Key words: Traditional foods, women of childbearing age, food diversity score, food intake Acknowledgement: This study was funded by Bioversity International.

25

RELATION BETWEEN LEPTIN-ADIPONECTIN RATIO AND BODY FAT, INSULIN, GLUCOSE AND LIPID PROFILE DURING NORMAL PREGNANCY

E. Aglago[1], I. El Menchawy[1], M. Azlaf[1], B. Rabi[2], A. Barkat[3], H. Belghiti[4], A. El Hamdouchi[1], K. El Kari[1], R. Benguedour[1], N. El Haloui[1]

[1]UMRNA, URAC 39, Faculty Of Sciences, Ibn Tofaïl University, Kénitra, Morocco
[2]Ministry of Health, Morocco
[3]Hospital Center Ibn Sina, Children's Hospital, Rabat, Morocco
[4]Military Hospital, Mohammed V, Rabat, Morocco

Background and objectives: Development of capacities in childhood and adulthood depends primarily on the environnement during pregnancy. Leptin and adiponectin are adipokines involved in food intake and energy balance of the human, especially during pregnancy. The leptin/adiponectin ratio (LAR) is related to insulin resistance and diabetes in non pregnancy conditions. The aim of this study was to evaluate the relationship between LAR ratio and insulin, glucose and lipid profile during normal pregnancy.

Methods: A total of 32 women, pregnant of singleton foetus with a gestational age less than 11 weeks participated in this study. Recruited women were followed at 12, 22-24 and 34-36

weeks of pregnancy. Maternal body fat (BF) was assessed using the dilution of deuterium oxide (D_2O). Blood glucose, insulin, total cholesterol, HDL, LDL, triglycerides were also measured. Leptin and adiponectin concentrations were assayed using radioimmunoassay kits.

Results: Mean age of the participants was 26.8±5.8 years. LAR ratios during for the first, second and third trimesters were 1.99±1.41 ng/mg, 1.20±1.37 ng/mg and 1.19±1.41 ng/mg. LAR was positively correlated to maternal insulin levels in all trimesters (respectively r=0.64, p<0.001; r= 0.39, p=0.032; r=0.39, p=0.038). Additionally, HDL (r=0.45, p=0.012), LDL (r=0.41, p=0.023) at the first trimester, BF (r=0.48, p<0.01) at the second trimester, and glucose (r=0.48, p<0.01) at the third trimester, were correlated to LAR. LDL cholesterol (r=-0.39, p=0.039) was inversely correlated to LAR at the third trimester.

Conclusion: Insulin levels were positively correlated to leptin-adiponectin ratio in all trimesters of pregnancy. Maternal body fat, glucose, and lipid profile were also correlated to leptin/adiponectin ratio at some extent. These correlations suggested a relationship between maternal LAR and insulin resistance, and pregnancy dislipidemia.

Keywords: leptin-adiponectin ratio, lipid profile, insulin, glucose, pregnancy

26

IRON DEFICIENCY ANEMIA AND DIETARY PATTERNS OF 6-12 SCHOOL AGE CHILDREN IN KHARTOUM STATE: A HOSPITAL-BASED STUDY

S. Washi[2], M. Yousif[1], I. Bani[3]

[1]Dammam University, Dammam, Saudi Arabia
[2]United Arab Emirates University, Al Muwaiji - Al Ain, Saudi Arabia
[3]Jazan University, Jazan, Saudi Arabia

Background and objectives: Iron deficiency anemia remained a major public health problem among school age children in the developing countries. It has serious implications and negative consequences on cognitive and physical development of children, their immune mechanisms and future work productivity. This study aimed at identifying the prevalence of anemia, iron deficiency and iron deficiency anemia among 300 school-age children (6-12years) recruited at a Pediatric hospital in Khartoum, capital of the Sudan when came for checkup, or referred to the pediatric outpatient clinics for follow up.

Methods: There nutritional status was assessed using anthropometric and dietary parameters and blood samples were collected for cell counter analysis and measure of serum ferritin. Those parameters were correlated with their demographics and the possible associated risk factors for anemia and iron deficiency anemia were identified.

Results: Overall prevalence of anemia was 31.3% with rates of mild, moderate and severe anemia being 81.0%, 11% and 8% respectively. Unexpectedly, anemia was significantly low with consumption of milk (P=0.040), milk products (cheese) (P=0.020), whole wheat products (P=0.015), and Mango (P=0.042). On the other hand it was significantly higher in children consumed bread (P=0.042), and sorghum (P=0.030).

Conclusions: Iron deficiency was 15.3%, and the prevalence of iron deficiency anemia was 5.2% constituting16.7 % of all anemic children in the study.

Key words: iron; anemia; school children; iron deficiency anemia; dietary patterns

27

POLYMORPHIC VARIANTS OF RBP4 GENE STUDY IN OVERWEIGHT CHILDREN

P. Allepuz-Fuster[1], J. Carrasco Luna[1], V. Guillem[2], P. Codoñer Franch[1]

[1]Dept. P.O.G. Fac. Medicina y Odontología Universidad de Valencia, Valencia, Spain
[2]Fundación Investigación Hospital Clínico- INCLIVA, Valencia, Spain

Background: RBP4 is the only vitamin A transporter found in blood circulation and is currently associated with a role as an adipokine related to insulin resistance. Previous studies link the plasma RBP4 concentration to overweight, DM2 and insulin resistance. The function of genetic variability of specific SNPs of this gene has not been fully described.

Objectives: The goal of this study is to examine the relation between 5 SNPs of RBP4 with distinct phenotypic traits associated with overweight individuals.

Method: This study collects data of children between the ages of 5 and 16, which had the SNPs rs10882273, rs3758538, rs3758539, rs34571439 and rs12265684 of RBP4 genotyped in peripheral blood with DNA extraction allelic discrimination and PCR amplification looking for correlations with phenotypic traits in blood biochemistry, holding into account the laws of mendelian inheritance using SNPstats software. Results: In the population studied, no statistically significant correlation between the SNPs analysed and insulin resistance was found, which agrees with previous studies. Nonetheless, we have identified a statistically significant risk factor, SNPs rs12265684 (p=0.019 and OR=2.34), rs10882273 (p=0.03 and OR=2.60), rs3758539 (p=0.024 and OR=2.67), rs34571439 (p=0.019 and OR=2.80); related to the levels of triglycerides in plasma. However, the SNP rs12265684 seems to present a protective factor (more trails needed)

Conclusion: The observation of the recesive allele in the polymorphic sequence rs12265684, rs10882273, rs3758539

and rs34571439 stands as a risk factor for high levels of triglycerides in overweight children. However, we cannot associate it with insulin resistance and whether these individuals are more prone to develop diabetes.

Key words: RBP4, children, overweight, SNPs

28

THE EFFECT OF MORINGA OLEIFERA LEAF EXTRACTS SUPPLEMENTATION TO THE PREGNANT WOMEN IN PREVENTING MATERNAL DNA DAMAGE

A. Otoluwa[1], A. Salam[2], Y. Syauki[3], N. Hasan[2], Y. Monoarfa[4], V. Hadju[2]

[1]Faculty Of Medicine Hasanuddin University, Makassar, Indonesia
[2]Department of Public Health Nutrition, Hasanuddin University, Makassar, Indonesia
[3]Department of Clinical Nutrition, Faculty of Medicine, Hasanuddin University, Makassar, Indonesia
[4]Department of Public Health Nutrition, Tompotika University, Luwuk, Indonesia

Background and Objectives: The extracts of Moringa oleifera leaf have been proven to have potent anti oxidant activity, prevent oxidative damage to major bio molecules and afford significant protection against oxidative damage. DNA damage in pregnancy, particularly that caused by oxidative stress, has been associated with adverse pregnancy outcome including preeclampsia (PE) , and intra uterine growth restriction (IUGR). In Senegal, Moringa oleifera was used to remedy anemia in pregnancy, and reduce prevalence of low birth baby. This study aims to assess the effect of Moringa oleifera leaf extracts supplementation in preventing maternal oxidative DNA damage.

Methods: This is a double bind, randomized control trial study, which was conducted in Gowa District, South Sulawesi Province, Indonesia, from January to December 2012. Seventy six of first trimester pregnant women enrolled in this study. They were randomized to the intervention and control group. Intervention group received Moringa oleifera leaf extracts with fe+folic acid capsules, while the control group received only fe+folic acid capsules for three months. Before and after intervention, blood samples were extracted for measuring of 8-hydroxy 2 deoxyguanosine (8-OH-dG) using ELISA method. The effect of intervention was analyzed by comparing the mean concentration of 8-OH-dG before and after, and between two groups.

Results: In the supplemented group, mean concentration of 8-OH-dG was reached 36.16 pg/ml and significantly reduced during the intervention by 36% (p=0.000). 8-OH-dG levels were higher in the control group (36.90 pg/ml), and reduced by 30.4% (p=0.019). The mean difference was not significant between two groups (p= 0.278).

Conclusions: The result indicate there was no significant difference in the level of 8-OH-dG between intervention and control group but the percentage of velocity in the intervention group larger than control group.

Key words: Moringa oleifera, Maternal DNA Damage

29

EFFICACY OF A MULTIPLE MICRONUTRIENT FORTIFIED MILK ON COGNITIVE PERFORMANCE OF SCHOOL-AGE CHILDREN

A. Mehdi[1], K E. Aglago[1], I. El Menchawy[1], A. El Hamdouchi[1], K. El Kari[1], M. Gour[1], N. El Haloui[1], E. Rjimati[1], M. Mzibri[1], H. Aguenaou[1]

[1]UMRNA, URAC 39, Ibn Tofail University-CNESTEN, Kenitra, Morocco

Background and objectives: Micronutrients deficiency is a serious health issue affecting children's ability to learn. Regular consumption of fortified foods is and efficient mean to address micronutrient deficiency during childhood. This longitudinal, randomized, and double-blind study aimed to evaluate the efficacy of an enriched milk breakfast intake on the micronutrient status and cognitive function in school-age children participating in a national school-based program providing food fortified with multiple micronutrients.

Methods: A total sample of 351 children, aged 7-9 years was recruited in three schools of the remote regions of Azilal in Morocco. The children were followed for a total period of 9 months, where daily milk was provided (weekends and scholar holidays included). The experimental group (N=123) and the control group (n=238) received respectively 200 ml of fortified (with iron, vitamin A, vitamin D, and iodine) and non-fortified milk. Cognitive function was assessed by the Raven's progressive matrices test at baseline and 9 months.

Results: The sample was constituted by 47.1 % of girls and 52.9% of boys. The mean of raw scores of the Raven's test at baseline were respectively for the experimental and the control groups 0.38±1.73 and 0.36±1.62. At the end of the study, experimental and control groups showed respectively 0.53±2.12 and 0.22±1.43. There were no significant differences between both groups at baseline (p=0.94) and at the 9 months (p=0.16).

Conclusion: The daily consumption of fortified milk did not improve the cognitive function of children over a period of 9 months.

Key words: cognitive function, micronutrients, fortification, school feeding, children

EARLY CHILDHOOD STIMULATION AND NEURODEVELOPMENT IN CHILDREN OF 12 AND 24 MONTHS OLD WITH ANEMIA

L. Villa[1], K. Arceo[1], E. Thébar[1], F. Olvera[1]

[1]Un Kilo de Ayuda A.C., Mexico

Background: The first two years of life are the most important when it comes to growth and brain development, requiring a high intake of iron. Otherwise, a low intake of iron can lead to anemia and therefore provoke negative effects on physical and intellectual development.

Objective: Identify the relation between the stimulation provided by the mother and the neurodevelopment in children at 12 and 24 months old with anemia.

Material and methods: Hemoglobin quantification of capillary blood was obtained from 22,485 children. Children categorized with anemia had levels under 11.0g/dl. The neurodevelopment was evaluated with standard Child Psychomotor Development testing in children at 12 and 24 months old, considering 12 observable behaviors in 6 areas of development. This test categorize neurodevelopment as normal, mild, moderate and severe. The stimulation provided to the child was assessed by a 24 questions inventory. Each question had two answers (yes =1.0 or no=0.Sufficient stimulation was classified with a score between 21 and 24 points, and as insufficient stimulation with a score less than 20.

Results: Children without anemia who received sufficient stimulation had 78% acceptable neurodevelopmental levels. Children with anemia receiving sufficient stimulation reported a 71% acceptable neurodevelopmental levels. In the other hand, children with anemia and without anemia with insufficient stimulation showed 56% and 54% of acceptable neurodevelopment. The same trend was observed by each group of age.

Conclusions: Environmental factors such as early childhood stimulation provided by the mother at home may favor the neurodevelopment in children at 12 and 24 months old even with the presence of anemia. Early childhood stimulation becomes a complementary strategy to promote adequate psychomotor development of children.

Key words: Neurodevelopment, early childhood stimulation, anemia.

31

INCIDENCE OF NEURAL TUBE DEFECTS IN BRAZIL BEFORE AND AFTER FOLIC ACID FORTIFICATION

L. Pacheco Santos[1], H G. Rodrigues[2], R C. Lecca[3]

[1]Universidade de Brasilia, Brasilia, Brasil
[2]Universidade Pitágoras, Brasil
[3]Ministry of Health, Brasil

Background: In June 2004 the Ministry of Health determined the mandatory fortification of wheat and corn flours with iron and folic acid to prevent the occurrence of anemia and Neural Tube Defects (NTD), conditions known to impair child mental development.

Methods: The study analyzed the incidence of NTD, from 2000 to 2010, based on the Ministry of Health birth and death registries. Live births with abnormalities and fetal deaths with NTD were identified by the International Classification of Diseases (ICD-10), codes Q00 (anencephaly), Q01 (encephalocele) and Q05 (spina bifida). Data from eight Brazilian states with adequate coverage of the live birth information system (SINASC) and mortality information system (SIM) were analyzed (Espirito Santo, São Paulo, Rio de Janeiro, Paraná, Santa Catarina, Rio Grande do Sul, Mato Grosso do Sul, Distrito Federal). Incidence for the periods 2000-2004 and (2005-2010 were estimated and compared by Student's t test.

Results: A total of 15,125,782 live birth registries and 162,393 fetal death registries were analyzed, resulting in the identification of 6,657 cases of NTD among live births (incidence 0.44/1,000 live births) and 2,389 fetal deaths related to NTD (incidence 14.73/1,000 fetal deaths); the overall incidence of NTD in live births and in fetal deaths was 0.59/1,000 births, during the period under study. The time series showed a sharp decline of incidence in 2005, which remained until 2009. The average incidence was 0.68/1,000 births for the period 2000-2004 and 0.51/1,000 births after the mandatory fortification of flour occurred (2005-2010). The t test indicated a significant decrease in the average incidence of NTD (p value 0.001) in the two periods studied.

Conclusions: These promising results seem to indicate the effectiveness of this policy; however a follow up for longer periods is necessary in order to confirm such an effect.

Key words: folic acid, neural tube defects

32

LONGITUDINAL GROWTH IN MEXICAN CHILDREN FEEDING WITH VEGETARIAN DIET

M E. Acosta[1], K Z. Escobar[1], A. Sánchez[1]

[1]Universidad de Montemorelos, Nuevo León, Mexico

Longitudinal Growth in Mexican children feeding with vegetarian diet Acosta ME; Escobar KZ; Sánchez A Health Sciences Department-Nutrition School Montemorelos University, México.

Background and objetives: The aim of this study was to know the longitudinal growth in children and teenager feeding with vegetarian diet in child day care center, during lactation and ablactation stages. A healthy diet in childhood can to reduce the prevalence obesity, malnutrition and chronic diseases in adult life.

Methods: The design of study is prospective cohort study. Include 76 teenagers, (43 male and 32 female). Anthropometric measurements were P/E, T/E, and BMI in two times, during lactation stage and eight years later. The BMI z score for age and sex was calculated and classified according to the WHO 2006. Analyses were conducted using SPSS for windows version 17.0. Written informed consent was obtained from all mothers.

Results: The 7.9% the children have overweight and obesity during the first year, eight years later increase in the same population to 9.2%, whereas the undernourished is 15.7% and decrease to 11.8% in the second evaluation, respectively ; 13.2% shew high height y 34.2% low height in the first evaluation and eight years later the low height decrease to 25% and increase to 60.5% the high height. Only, 7.8% are breast feeding. And Actually 8% to eat a vegetarian diet. This study be continue until to adult life and will be analize others variables.

Conclusions: Early life is the time when dietary practices are established and the type of foods introduced might model food habits that will continue throughhout childhood and others stages. The planned Vegetarian diet no affect the physical growth in children and adolescents, inclusive can to be a model to prevent chronic disease and to control their results in others times.

Key words: Growth, vegetarian diet, children

33

GROWTH IN PRE-SCHOOL CHILDREN FROM 3 EUROPEAN COUNTRIES AND ITS RELATIONSHIP WITH DIETARY DIFFERENCES

M J. Piqueras[1], C. Campoy[1], M T. Miranda[1], T. Decsi[2], B. Koletzko[3], P M. Emmett[4]

[1]University of Granada, Granada, Spain
[2]University of Pécs, Pécs, Hungary
[3]Ludwig-Maximilians-University of Munich, Munich, Germany
[4]University of Bristol, Bristol, UK

Background and Objective: Obesity in childhood is very common in Europe. It may be linked to diet and intakes of protein and polyunsaturated fatty acids (PUFA) have been investigated. The study aims to investigate growth and dietary differences at age 4 years between three European countries and assess dietary adequacy.

Subjects/Methods: 161 four-year-old children from Spain, Germany and Hungary whose mothers had participated in a pregnancy micronutrient supplementation trial. Growth was assessed by standardised anthropometry and diet calculated from parentally-completed food frequency questionnaires. Adequacy of the diet was evaluated using US guidelines. Physical activity was not assessed.

Results: The Spanish children had a higher mean BMI (16.4Â±1.5) than German (15.7Â±1.0) and Hungarian children (14.9Â±1.4, $p<0.01$). In Spanish children, dietary intakes were higher for animal protein density particularly from dairy products, whereas there was little difference in total protein density and slightly lower n-6 PUFA density than the other groups. The diets of many children were lacking in some nutrients; 94.4% were below the recommendation for potassium, 64.4% for iron, 40% for folate and 100% for Vitamin D. However intakes were higher than recommended for saturated fat (in 96.4% of children) and sugar.

Conclusions: Diets eaten by Spanish children may be more obesogenic than those eaten by German or Hungarian children. Evidence showed that many children in all three countries are eating diets that are low in nutrient content but high in fat and sugar.

Key words: diet, growth, pre-scholar children The research leading to these results has received funding from the Commission of the European Community -specific Research and Technological Development Programme, "Quality of Life and Management of Living Resources" within the 5th to 6th Framework Programmes: NUHEAL Study, EARNEST Project and NUTRIMENTHE Project.

[3]Clinical University Hospital San Cecilio, Granada, Spain
[4]Department of Paediatrics, Granada, Spain
[5]Department of Clinical Psychology, Evaluation & Personality. University of Granada, Granada, Spain

Introduction and aim: Obesity and type-2 diabetes (T2D) in pregnancy are associated with nutritional deficiencies and adverse metabolic adaptations in the mother, compromising foetal-newborn survival and with a special impact on the developing brain. We analyse if the placental epigenetic changes in obese and diabetic pregnancies are involved in brain development.

Methods: 120 infants, participanting in the PREOBE study* which were born to: Healthy normo-weight (n:48), Overweight (n:27), Obese (n:13) and Gestational Diabetic (GD) (n:32) pregnant women, were included in this analysis. Several oligonucleotide primer sequences were used for quantification of target and endogenous control gene cDNA by real-time PCR. Babies were neuropsychological examined with the Bayley III at 6 and 18 months of life. ANOVA, Kruskall-Wallis, t de Student and logistic regression were performed.

Results: AMPK and P70S6KB1 were down-regulated and MTHFR was up-regulated in the placenta of GD mothers. At 6 months, Language Composite Score (LCS) was higher in those babies as much as MTHFR were up-regulated (OR: 1.620; IC: 1.101-2.385); Motor Composite Score (MCS) were positively related to AMPK up-regulated level at 6 months (OR: 2.516; IC: 1.167-5.422) and to IRS1 up-regulated at 18 months (OR: 1.889; IC: 1.009-3.537). Babies with the highest level of IRS1 up-regulated had more possibilities to have a better Cognitive Composite Score (CCS) at 18th months of life (OR: 2.119; IC: 1.112-4.036). Babies born to obese and GD mothers with high levels of P70S6K up-regulated showed higher LCS at 6 months (P=0.018) and at 18 months (P=0.042). Babies born to obese mothers with higher level of AMPK up-regulated showed higher CCS at 18 months of life (P=0.037). ** This study was granted by Junta de Andalucía: Excellence Projects (P06-CTS-02341) and Abbott Laboratories-General Foundation University of Granada (Contract agreement: 3346).

Key words: early programming, obesity, diabetes, cognition

[6]EURISTIKOS Excellence Centre For Paediatric Research. Department of Paediatrics, University of Granada, Spain

Introduction and aim: Persistent accumulation of organochlorine compounds (OC) in adipose tissue is related to neurological damage. We aim to evaluate the long-term neurodevelopment effects of intrauterine exposure to OC in children participants in the NUHEAL Spanish cohort.

Methods: 154 Spanish pregnant women were randomized to receive 500 mg docosahexaenoic acid (DHA)+150 mg eicosapentaenoic acid (EPA), 400 µg 5-Methyltetrahydrofolate (5-MTHF), both or placebo from 20 weeks up to the delivery. Blood samples were obtained from 96 mothers-baby pairs at delivery. OC were determined using HPLC, GC/ECD and GC/MS and were expressed in ng/g of lipids. The offspring were followed-up and revised at 7.5 and 9.5 years old, evaluating their neurodevelopment outcomes by using the NUTRIMENTHE Neuropsychological Battery. ANOVA, Bonferroni test, multiple lineal regression and quantile regression were done using the SPSS 20.0 and STATA 12.

Results: There were no significant differences on the OC concentrations between groups neither on the long-term neu-

rological outcomes depending on the prenatal supplementation. At 9.5 years, those children whose mothers had high Mirex concentrations in plasma showed long-term negative effects in verbal comprehension (language) (Token test B = -0.061, p=0.001, IC= -0.097 a -0.026) and in viso-perceptual integration (perception) (HVOT test B = -0.051, p= 0.03, IC= -0.097 a -0.005). The regression analysis was adjusted by smoking, age and maternal schooling but with any statistical significance. Furthermore, those children exposed prenatally to the highest levels of Mirex were under 25 percentile in the scoring above.

Conclusion: From the OC analysed, Mirex concentrations during pregnancy seems to have a major negative long-term effect on verbal comprehension and perception integration in children at 9.5 years. **This work was partially supported by the NUTRIMENTHE EU Project, Grant agreement nº: 212652 and by the Spanish Ministry of Health (FIS 02/1314, FIS G03/176) and European Union (QLK4-CT-2002-00603-EDEN and NoE CASCADE-2003-506319).

[4]Helmholtz Zentrum München, Research Unit of Molecular Epidemiology, Neuherberg
[5]Department of Paediatrics, Ludwig-Maximiliams, University of Münich, Munich, Germany
[6]Department of Paediatrics, School of Medicine, University of Pécs, Pécs, Hungary
[7]Department of Paediatrics, University of Granada, Spain

Introduction and aim: There is no clear evidence about the long-term effect of prenatal supplementation on children neurodevelopment. We aim to improve this hypothesis by a systematic evaluation of the metabolite profile in urine from the offspring born to prenatally supplemented mothers participants in the NUHEAL study.

Methods: A non-targeted LC-MS method (using both Ion Trap MS and Time of Fight MS) was used to analyze 537 samples, from NUHEAL children at 7.5,8,9, and 9.5 years, to evaluate the long-term effects of prenatal supplementation in their mothers with fish oil (FO), 5-Methyl-tetrahydrofolate (5-MTHF), both or placebo, from 20 weeks of pregnancy until delivery. All possible metabolites within the chromatograms were identified using commercial available standards and TOF capabilities. Statistical treatment involving pre-processing of the chromatograms by removing baseline and correcting for elution time shifts, PCA and PLS-DA was applied checking the structure of the data set and possible systematic groupings. The described LC-MS metabolomics data were studied in combination with some other relevant data, such us fatty acid in cheek cell, neurodevelopment data, FADS1 and FADS2 genotype, dietary intake and relevant confounders.

Results & Conclusions: No significant differences in metabolic profile in urine were demonstrated between groups. Fatty acid status in cheek cell and fatty acid related features in urine samples of children at 7.5 to 9.5 years of age reflected the dietary intake of essential fatty acids and their major LC-PUFA derivatives. Significant relationships between fatty acids intake, metabolites excreted in urine and cheek cell FA were shown. Daily intake seems to have a remarkable influence in the metabolic profile. The influence of FADS1 and FADS2 genotype was reflected in fatty acid related metabolites excreted in urine. **This work was supported by the NUTRIMENTHE EU Project, Grant agreement nº: 212652.

COMPARISON OF THE ANALYTICAL PERFORMANCE OF DIFFERENT LC-MS METHODOLOGIES TO EVALUATE LONG-TERM EFFECTS OF DHA AND 5-MTHF SUPPLEMENTATION IN PREGNANT WOMEN ON THEIR OFFSPRING METABOLOMIC BIOMARKERS

C. Martínez-Zaldívar[1], A. Carrasco-Pancorbo[2], O A. Mayboroda[3], C. Campoy[1,3]

Introduction and aim: Mother's nutrition before and during pregnancy and nutrients intake during early life seems to

be linked to later neurodevelopment and long-term behavior outcomes. Modern "omics" technologies open up great expectations to improve the understanding of the mechanisms involved in the role of early nutrition on neurodevelopment. We aim to optimise two complementary LC-MS methodologies to evaluate the long-term effect of DHA, 5-MTHF, both or placebo supplementation received by NUHEAL pregnant women, on their children urinary metabolic biomarkers at 7.5 years.

Methods: Three different sample preparation protocols were compared (protein precipitation and metabolite extraction, simple urine dilution and liquid-liquid extraction), being the first one the optimal extraction system. Two different kinds of columns were used (C-18 and HILIC columns) to compare the performance of two complementary LC methodologies (reverse phase and HILIC). The chromatographic parameters as well as detection conditions (UV, fluorescence and MS detection on-line) were optimized pooling urine samples of all the individuals included in the study. A systematic evaluation of the analytical parameters describing the performance of the two methods was carried out (both with pooled urine samples and a standard mix) considering detection and quantification limits, linearity, calibration range, repeatability intra- and interday, accuracy, etc.

Results and Conclusions: The potential of the two methodologies to determine compounds belonging to diverse chemical categories (amino acids and related compounds, organic acids, alcohols, xanthines, amines, dipeptides, amine groups, compounds with indoles groups, with imidazol groups or with hydroxyl) is extensively discussed in the current contribution. Moreover, the analysis of 138 urinary samples from children at 7.5 years were collected using both LC-MS methods. The quantification of different metabolites was performed, specially for methylmalonic acid, homocysteine and folic acid derivatives. **This work was supported by the NUTRIMENTHE EU Project, Grant agreement nº: 212652.

NEURODEVELOPMENTAL STATUS IN BABIES BORN TO OVERWEIGHT, OBESE OR DIABETIC PREGNANT WOMEN, DURING THE FIRST 18TH MONTHS OF LIFE

F J. Torres-Espínola[1], A. Jerez-Calero[2], M T. Segura[1], R. Moreno-Torres[1], C. Robles[1], M. Pérez-García[3], F. Cruz[3], C. Campoy[1, 2]

[1]EURISTIKOS Excellence Centre For Paediatric Research, University of Granada, Spain

[3]Department of Clinical Psychology, Evaluation & Personality, University of Granada, Spain

Introduction and aim: Obesity and Diabetes are related to poor nutritional status, with demonstrated nutritional deficiencies, gut absorptive alterations, less bioavailability, increase of oxidative stress and/or inflammatory status. We aim to analyse the potential negative effects of these metabolic situations on the foetal brain.

Methods: 217 infants' participants in the PREOBE study* were included in this analysis: Healthy normo-weight (n:81), Overweight mothers (n:44), Obese (n:31) and Mothers suffering Gestational Diabetes (n:61). The babies born at 39.52±1.26 weeks, with birth weight adequate for gestational age. No differences were shown in the neonates between the studied groups. The offspring were neuropsychological examined with the Bayley Scales of Infant and Toddlers Development, Third Edition (Bayley III) at 6 and 18 months of life. Statistical analysis: ANOVA, Kruskall-Wallis, t de Student, and logistic regression.

Results: Infants born to Obese mothers showed higher Standards & Composite Scores in Cognition (P=0.003), Expressive Communication (P=0.016) Language development (P=0.008) at 6 months of age. The present results shown that higher pre-conceptional weight in the mother determines better Language Composite Score at 6 months of age (OR:1.133). These differences disappear at 18 months because the rate of change between 6 to 18 months does not exists in these infants (P<0.05).

Conclusion: Offspring born to obese mothers showed higher cognitive scores at 6 months of life, probably due a major nutrient transplacental transfer in obese pregnancies regulated by epigenetic changes in the placenta, which probably exert a transient effect. However, the negative rate of change in cognitive scores from 6 to 18 months in the offspring born to obese mothers suggests that obese condition during pregnancy could have a negative long-term effect on neurodevelopment. ** This study was granted by Junta de Andalucía: Excellence Projects (P06-CTS-02341) and Abbott Laboratories-General Foundation University of Granada (Contract agreement: 3346). Key words: early programming, obesity, diabetes, cognition.
